Just poke 580 with any number but 0. Great for basic, don't quite work in
a 130, you know memory refreshing....

Sorry but 8 sprites... in Atari you can have in maximum res 192*5
players and in takes only a little DLI routine.... Atari can scroll by 1
pixel and you only manage 2 bytes and you tell me VIC is better than Antic??
The main difference between the A8 and the C64 is the interrupt management,
if you use the int mag in the right way nothing is impossible in the A8....
God even the space invaders A8 version is better than the 64 one.... At least
the Atari is not CHEAP assembled...

Sometimes, the best way to learn more about your computer is a Flame war
as you name it, and if both parts learn then nothin is loose in the process,
besides is fun thing to do, as i own both platforms and know far more of the
Atari than commodore, and of course the 64 is easier to repair, it has far
less IC's than the Atari...

I'm wondering the same thing about computers. The 333 MHz PC is about the
hottest Windows machine you can get at a Fry's or CompUSA, yet I hear that in 2
years, 1000 Mhz machines will be available, and the the 200 MHz machines of
just last year won't be fast enough for the software that will come out in
2000. So in 3 years, you go from $2000 computer to obsolete. Will consumers
stand for that?

POKE 580,1 causes RESET to coldboot the system. I can't really remember what POKE 53774,1 does, but I think it's close! I think doing something like POKE 16,64:POKE 53774,64 disabled the break key, but I'm not completely sure!

There's also a way of causing RESET to make an error message, and then you can use the TRAP command to cause the reset key to re-run your programs - I can't remember exactly how that's done - I remember reading something in an old Atari User I think... Hope this helps, or interests!

>power? etc...
>
>Any help appreciated.
>

Sure, it's possible; in fact, it's quite easy. Although I wouldn't recommend it, since you might lose the functionality of the SIO port, here is my suggestion. If you follow the plans to build the SIO2PC cable, just make sure you use SHORT lengths of SIO cable, so that you can cram it all into the case. On an 800, there's ample room, but on a 130XE or similar case, it's a tight fit. Just make your pin connections directly to the back of the SIO port. You'll need to cut a hole in the back of your A8 to make room for a 9-pin serial port (male or female isn't really important, just remember you'll need a matching cable to go to the PC). The instructions for building the cable recommend putting the IC in a project box, but you could probably attach it inside the case, either with short screws or some double-sided sticky stuff.

The standard SIO2PC cable requires no power source, at least not an external one. If it draws power from anywhere it would be from the Atari's +5 voltage, so this solution would still take advantage of that. The quad-receiver/diode/resistor IC is actually used to eliminate this voltage so that it doesn't blow the PC's serial port.

Building the cable separately is obviously much less destructive on the A8 equipment, but if you really want an internal serial port, it's definitely feasible.

I'd be interested to hear from someone with more technical experience about what impact this solution would have on the SIO port. Since you can daisy-chain the drives, I believe this would allow the port to continue working, but I can see where this might cause some conflict. Any theories?

APPLAUSE, APPLAUSE, APPLAUSE, APPLAUSE.

Forte's Agent, even Free Agent, kicks major newgroup butt. I use both
IE4.0 and Netscape 4.0 for web browsing, but I'll never step into
comp.sys.atari.8bit with anything but Agent. Besides, the bullies

don't even handle newsgroup management effectively; why should we let them step in with HTML code. If the HTML standard is ratified, then we'll follow, but until then...

http://www.forteinc.com/agent/freagent.htm
If you don't have it, GET IT (it's free, after all), then you'll see the difference.

Steven

P.S. I get nothing for supporting Forte's Agent or Free Agent except the peace of mind that I've found a great piece of Windows software and I want to share it with everyone I can.

As for the Lynx and the Portfolio they were both developed from other
companies. Everything the Tramiels did, was to buy the rights and to
sell them under the ATARI brand name. There were no improvements done by
ATARI.
So if the Tramiels hadnï¿½t bought the systems other companies would have
done this.

Yeah! I have already had SRAM with alkaline battery in my Atari. It
works fine over two years on the same battery! SRAM is not so expensive.
128 kb costs about $5 (in Poland). I would like to write new OS for
Atari which could give some new features to this machine, such a
continuing work after long period without power supply! I would write it
years ago, but I have no time!... But it WILL work! Believe me!

Alex Martin

P.S.
Ni-Cad battery pack is bad idea, because if it will end all memory's
data will fly away (oh, maybe half an hour later, because of cap!)

Hasbro bought Tiger because of their excellent position in children's electronics. Tiger makes tons of handheld games, including all of the game show units (Wheel, Family Feud, Jeopardy!, etc.), Giga Pets, and the children's educational "computers" (they are the only real competition to V-Tech). Hasbro is trying to keep up with Mattel in the toy industry; both are running around buying up all of the smaller toy companies that complement the businesses that they already own. Tiger was attractive to them because they really don't have anything in the way of handheld electronics or kid's computers. They also got ahold of the game show licenses, which their other divisions can use, like Parker Brothers, Milton Bradley, and CAP Toys (candy - you've probably seen the Connect Four and Monopoly candy...expect more!)

Tiger was also bought by Hasbro, Inc., while Atari was purchased by Hasbro Interactive. This may mean nothing, but it may signal that Tiger is considered more of a toy company to Hasbro, while Atari is considered

more of a software company. I personally would expect HI to use the software licenses first, making new versions of the titles that they now own, then maybe look at the videogame market to see if it is a viable market for them. They don't own facilities to make something as large as a CD console system and would not be able to make one as cheaply as someone like Philips, but they might license the Atari name. The portable market is about to change a bit with the new Nintendo color portable, so if they're smart, they will wait and see what happens there. Just my $0.02 (still $0.02 with tax!!)

I have something like that in one of my Atari's. It works, but it is not so functional as a cable. Trust me, when You want to visit Your friend and he has no SIO2PC cable it is the only way. And by the way, I have built SIO2PC cable without MAX232 and other chips on 3 transistors! (My friend do the same thing but on one NAND gate, one diode and one resistor only). All these interfaces works very well but of course the cable can not be too long.

Hmmm! I don't know how about NTSC, but in PAL I made 384x240 (4
interlaced shades) on standard Atari, so...
Besides, Have You ever seen HIP graphics mode?

Alex

Wait, wait! I just want to say that VIC's sprites are better in a few
things (f.e. quantity...) and 16 color mode which has 2 pixel points can
be scrolled by 1 pixel just like in HIP on Atari.

Yes, I know. I am and Atari user. I wrote lots of code on it and I know
whole its build.

Anyone know where I can get ahold of Util?

Im assuming this would allow me to avoid having to use my SIO2PC cable
to transfer files from my PC to my Atari and vs versa?

2935. Using Genesis pads on Atari 8 bits?

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-16 00:00:00 UTC
From: swozniak@aol.com
Message-ID: <19980316194900.OAA14567@ladder01.news.aol.com>
Source record: 64677

I've been using my Sega Genesis 6-button pad on my Atari 800. I love the feel of this pad but I do have one concern. Since the Atari is set up to only recognize 1 fire button, is it possible that pressing some of the other buttons on the Genesis pad could send an unrecognized register/voltage to the Atari and screw it up?
Any help on this matter would be much appreciated. (Not to mention set my mind at ease.)

So in 3 years, you go from $2000 computer to obsolete. Will consumers >stand for that?

>Bostone1@aol.com

I agree with you on this. But it's already been going on for about 9 years now.

In 1989 it was the "386", with the 33MHz being the top speed you could achieve, at a nice hefty price. However, a lot of software still ran on those XT's.

In 1991 it was the 486, with the 33MHz being the top speed you could achieve, at a nice hefty price, but most software would still run on the 386's. Windows 3.1 was released.

In 1993 the Pentiums came - 66MHz top speed, 386's were out-dated, 486's slower then 50MHz were starting to get outdated.

In 1995 the 100+ MHz pentiums started to show up (up to 133MHz), in August 1995 486's were made obsolete. Windows 95 was released.

Now, you need a minimum of Pentium 133MHz to get any useability, and a lot of software won't run on anything slower then a 166MHz Pentium. By the end of 1998 you'll need to have a minimum of 200-233MHz Pentium with MMX. Windows 98 should be released this year.

Personally, I believe consumers will get tired of having to shell out several thousand every couple of years.

I expect after the turn of the century you won't see major performance increases in CPU speed, but then bandwidth will become the big improvement factor. I also expect to see more happen with NC's as bandwidth increases.

The really sad thing is I think about what I used to use my Atari 800XL for back in 1984; word-processing, e-mail, games, programming. It served me well from 1983 until I jumped onto the PC Bandwagon in 1989. I could still use it today (and am in the process of putting together another 8-bit system, anyone got an MIO for sale?), and it would work well. However, the thought of using my first PC (a 10MHz 8086) scares me, where the atari would be fine.

>in fact 3rd highest seller by volume at one point.

But they didn't bring the products to the states. They kept putting us off here in the US because the margins were higher in Europe. And, by the time 1989 had rolled around, Atari had left a bunch of die hard 8-bitters who would have probably gone the ST route feeling like we were abandoned, and wondering what incentive there is to buy an ST when you'd be worried they'd pull the same one.

The way I remember my decision to go PC was that Atari had just recently announced the TT would be coming out soon and that support for the ST would be dropped back to the level of the 8-bit (non-existant). That's the day I decided to go to the PC and sell my 8-bit.

2939. Assembler Editor Cart via Emulator

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-16 00:00:00 UTC
From: jvincent@wizvax.net
Message-ID: <350d96a9.1936861@news.wizvax.net>
Source record: 64681

I've got a project that I want to use the Atari Assembler Editor cart for. For the actual project, I'll have to use my 800XL (it's tightly tied to the hardware), but since it's been a *long* time since I've used these tools, I'd like to refamiliarize myself with the language/interface and it would be a *lot* easier using a PC-based 8-bit emulator (probably Xformer).

Is it possible to convert the cart so it can be used with the emulator? Hardware/software available to me includes: 800XL, 1050 drive, Xformer cable (1050 to PC parallel), Assembler Editor cart, DOS 2.5, PC running Win95, and various versions of Xformer and utilities.

I've tried a binary save of $A000-BFFF to disk and reloading it, but I can't get that to work on the 800XL (I've heard that can't be done with DOS 2.5).

Thanks for any help you can offer! The simpler the better. :)

In article <350C0DD3.CA1480EB@sprintmail.com>,
Bob Evans <BobEvanz@sprintmail.com> wrote:
>Has anyone been able to hook an Atari 800 up to a SCSI JAZZ drive?
>Please tell me how to do this.
>

Off the top of my head, and on the basis of minimal experience with
a Zip drive on an Amiga, I would expect that you could treat a Jaz drive
the same as "any" SCSI HD of the same capacity. The questions then
become, first, "how do you hook up a SCSI drive to the Atari," and second,
"will the Atari handle a drive that big (capacity-wise)?"

The answer to the first question is well known: get an MIO or a Black
Box. If I recall correctly, the BB has a limit on how large a SCSI
partition it can work with "all in one piece;" therefore, HDs larger
than that limit bust be partitioned into pieces SMALLER than the limit,
and managed as though they were separate, smaller drives. Undoubtedly,
this would need to be done to a Jaz drive. Oh -- and my personal
experience with Zip drives indicates that they are sufficiently "generic
SCSI" devices that they "ought" to work with the BB/MIO, though I have yet
to try this.

The answer to the second question is less well known, but I can make
some guesses. First, I assume that the state-of-the-art of SCSI, at
the time the BB and MIO were invented, was such that both products use
SCSI 1. Second, I recall that in SCSI I, the number of bits reserved
for disk-block-number specification is too small to properly address
disks larger than "about 1Gb." (1Gb-and-larger drives can still be
CONNECTED TO, and used on, SCSI 1 -- but all operations which try to
access disk blocks beyond the "size limit," end up accessing the wrong
blocks and can easily corrupt the drive.) If I'm right and
the BB/MIO _do_ use SCSI 1, you would probably be able to CONNECT and
maybe even USE a Jaz drive -- but to use it SAFELY you would have to
restrict yourself to the first 1Gb of space (the best way to do that would
be to partition the drive in such a way that the "dangerous" area was
simply not available to you).

Hope this helps. Try it and let us know if it works!

Whether or not they bring the Atari name to hardware remains to be seen. If they are indeed a Project X liscensee they certainly would not say so, that is hush hush information. Secondly, if the Game.com fails they may attempt to revive their handheld market under the Atari name.

My philosophy was to sit in one place, and let the Zylons come to me. It required you to land as near the middle of the sector as possible. And when you start getting hit, get out out of there, as jumps to a starbase without a computer, or long range scanner is difficult. Without those or photons, life gets too difficult. Been a few years since I played, but I will have the computer hooked up to play again this weekend. :)

All true, but I was kinda hoping they'd try to revitalize the old name by releasing new titles. (Don't even know if they're going to release Centipede 3D under the Atari moniker...) Kinda rebuild Atari up from go, as it were. Realistic? Probably not. But it would have been nice. Kinda the same hope I had when Gateway purchased the Amiga properties. Haven't heard anything since.

Anyway,
Ryan

2949. Chess for Atari 8-bit

: minutes, which basically is most of the Atari licenses.

I don't mean to be annoying, but doesn't the description:

"1-dimensional games that only last 3 minutes"

apply to just about any console game? In general, I have always preferred
computer games to console fighting, platform, and other low depth genre's.
With games like AvP, the Jaguar had the potential to bring more
computerish titles to the console market, but they instead dropped that
sort of development in favor of SNES style titles.

Hola Preston,

In article <6egqpv$ak3$1@dartvax.dartmouth.edu>,
Preston F. Crow <crow@coos.dartmouth.edu> wrote:
>Assuming all of that info was correct, it looks to me like the C64 had
>better sound and its sprites may have been better for many purposes
>than Atari's player-missile graphics, but Atari had better graphics

Actually I'd say the 64 has better graphics -- twice as many custom characters,
more palette flexibility, and higher default resolution (all of 8 lines,
whoopee!). More about graphics in the next post.

One thing that is difficult to convey (and invariably lacking in most
computer wars etc.) is just _why_ some feature or capability is useful
or important. Presumably someone will followup with a "Yeah, but my
computer can do THIS", to which I will respond ahead of time "Name me
some situations it is useful for, and what makes you think the 64 can't
do the same thing?" :). In my experience, when one of those questions
has a decent answer the other has a lame answer. (Note that this
applies to various C64 claims equally well).

>and ran 70% faster (or does the 6510 use fewer cycles per instruction
>than the 6502?).

There are two main caveats. The obvious one deals with things like "It
doesn't take any cycles to change the y-coordinate of sprites on the 64";
the other rub is DMA: halting the CPU to access graphics data. Maybe
one of the demo guys can answer this question: how many cycles are
available per raster line on a typical 320x192 screen? (On the visible
portion of the screen).

On an NTSC 64 there are 65 cycles/line, except for every eighth line where
VIC steals 40 cycles for DMA, and there are 262 NTSC lines (PAL is
63 cycles/line with 312 lines, hence more cycles/frame). Sprites
take 2 cycles per active sprite.

I'm pretty sure the Atari still winds up being faster -- just not by a
factor of 1.8.

>Did I miss anything?
>
>Of course, that's just comparing the hardware.

Yup.

One more thing I should have mentioned: the Atari debut was in 1979;
the 64 in 1982. Three years is a pretty long time in the computer

world.

>
>Having 17 graphics modes says nothing about the quality. I would really
>liked to have a 320x200x4 mode like the C64 (or did it even have 16 colors?).

One important feature of the 64 is that color information is stored in RAM.
This means that all graphics modes can always display all 16 colors
simultaneously; for example, after turning on the computer you can type
sixteen characters, each with a different color, right from the keyboard/no
programming required.

The catch is that each byte of color RAM controls one 8x8 section of the
screen, so it's not as if single pixels can take any one of 16 colors;
it just allows different palettes in different areas of the screen.
Having said that, 320x200 mode gives you 2 colors in every 8x8 block
(pixels are either 0 or 1), and 160x200 mode gives 4 colors in every
8x8 block (pixles are 00 01 10 or 11). 'Nonstandard' modes are also
available (interlacing screens, force palette reloads every scanline,
etc.).

Two interesting sites with examples of 64 graphics are

http://www.geocities.com/SoHo/Studios/6463/ (many pics from demos and such)
http://oasis.home.pipeline.com/art.html (standard hires and multicolor)

Many games sites have lots of pictures, too.

>To me, the main advantage over the C64 was the ability to mix different
>modes as you pointed out above.

Well, it is worth pointing out that mixing modes is a piece of cake on the 64
(the current raster line number is readable, and VIC can trigger an IRQ
on any raster line). Rare is the game or demo that does not mix modes :).

evetS-

P.S. I really like your web page, and have found it to be very useful! You might consider adding a link to http://stratus.esam.nwu.edu/~judd/fridge/ in the 'programming' section.

In my experience, the best way to learn about a computer is to do some
research, study the available reference material, and take a little time
to figure out how things work and what they are useful for. (Actual
programming experience is quite handy, too).

Maybe that's just me. ;)

Unfortunatly I think using the Atari name would doom any product
released. Most of the gamers out there still have bad memories of
ATARI. Need I mention E.T.? or the Jag? I like my Jag I still play it
but because Atari screwed it up it is now dead. So any use of the
Atari name could prove fatal for any system, no matter how good it is.

I)m still waiting for that hardware expension port to be
plugged into the RS-232 port, or PCI connector, or ISA connector,
or whatever design they want to come up with.
I mean that plugin XL-XE system on one chip (or connector).
No need anymore to hook up your pc to your XL-XE anynore.
Just plug your XL-XE into your PC!
and run XL-XE programs right on your PC!
No need for emulators anymore!!! Yeah!
And people would write XL-XE programs on their PC for the XL-XE! Nice.
That what's I'm expecting from the sale of Atari (to whomever maybe)...

I think what's being asked is: If someone puts an SIO2PC device in their
atari, will they safely be able to plug other things into the SIO port *in
addition* to using the SIO2PC port?

Isn't there some kind of daisy-chaining protocol that needs to happen?

That sort of logic implies that Sega may as well just slose shop today, since their last two major products also died off quickly. The Atari name is still seen favorably - I can't count the number of times I have had to explain to people that the Atari in the arcades is NOT the Atari that made the Jaguar. And the retro gaming thing has heightened the perception of Atari as well.

This sale is getting mainstream news exposure. If the Atari logo appears on a new piece of hardware, the gaming public will know that it is "under new management".

Besides, I really don't think the majority of people out there is stupid enough to simply say "Atari? everything they make sucks" without first finding out what is going on. If Hasbro spends the money on good marketing to generate some positive hype, and on making some good games for any new hardware they make, then the Atari name will once again be embraced by the public. (Hey, Ford bounced back from the Edsel and the Pinto, didn't they?!?)

I don't remember which thread had this debate, and I really don't feel like looking for it, so I'm putting my two cents-worth right here.

To the guy who wants to post here using HTML:

Perhaps you might want to collaberate with someone like Itay Chamiel or Clay Halliwell on an Atari 8-bit offline HTML reader, and when it's done release it as freeware. I'm sure many of us would try it out. Until then, I, and the rest of the people using Atari 8-bits to access this newsgroup, would appreciate it if you'd stick to ASCII.

And as for the argument that you can express yourself more effectively using HTML because you can use italics, bold, etc., good writers show emphasis by choosing emphatic words, and avoid the use of italics. Effective writing has little to do with typefaces. It has everything to do with communication.

sites...
NEW YORK (CNNfn) - Just when you thought the
world was safe from Pong.
Hasbro Interactive Inc. announced Monday that it
has acquired copyrights, trademarks, patents and
other intellectual property assets of the Atari Division
of JTS Corp., giving Hasbro Interactive rights to
more than 75 Atari games.
Among the titles involved in the deal are such
popular 1980s video games as Centipede, Missile
Command, Pong, Breakout and Tempest. Hasbro
Interactive, a subsidiary of Hasbro Inc., plans to
release its first Atari title this fall with Centipede for
both the PC and Sony Playstation game console.
"These groundbreaking games helped pioneer the
video game industry," said Tom Dusenberry,
president of Hasbro Interactive. "We intend to bring
these classics back to life by updating them with the
latest technology and interactive game design, while

preserving their heart and spirit."
Hasbro Interactive is familiar with reviving popular
1980s video games. The company launched Frogger,
originally developed by Konami Co. Ltd., in 1997
for both the PC and Playstation.
Hasbro will market the games as both nostalgia
for video-game veterans and new experiences for
younger players.
"We plan to implement the same aggressive
strategy we used with Frogger in bringing back the
Atari classics," Dusenberry said. "We will develop
games that appeal to the players who loved the titles
as kids while attracting a whole new generation by
bringing the games up to today's highest standards."
Hasbro Interactive said it intends to develop
various titles for all gaming platforms, including PC
CD-ROM, Sony Playstation and Nintendo 64.
Shares of Hasbro (HAS) rose 3/8 to 36-7/8 in
midday trading.

This just in from Next Generation Online:

"From the first time today, Hasbro Interactive officially announced
its acquisition of key Atari videogame licenses. The assets purchased
by the company include games such as Centipede, Missile Command, Pong,
Breakout, Battlezone, and Tempest. For only $5 million the company
scooped up the rights to more than 75 Atari properties and hardware
platforms.
Hasbro currently has plans to develop several of these games on both
the PlayStation and PC. The first of these titles scheduled for
release will be Centipede, which will hit both platforms this fall.

"These ground-breaking games helped pioneer the videogame industry,"
Tom Dusenberry, president of Hasbro Interactive said. "We intend to
bring these classics back to life by updating them with the latest
technology and interactive game design, while preserving their heart
and spirit."

The company is also considering development of these titles on the
Nintendo 64, and will likely develop handheld versions of these games
via the Tiger Electronics division it recently purchased. At $335
million, the acquisition of Tiger's electronic division was costly,
and Hasbro will likely use its newfound licenses to shore up some of
the purchase costs."

====

So it appear Hasbro bought Atari for the games. I kinda hoped they
would have annouced that they would use the Atari brand name for the
games. Who knows, maybe they will. I'm happy to see updated classics
but I can't help be just a tiny but dissapointed. Time will tell.

Source record: 64604

Up until today, I have only owned an Atari 400 computer with 32K RAM. Many of my disk software items would not run, apparently due to the lack of RAM.

So I got an 800xl today that registers 37,xxx K RAM in BASIC when you turn it on. However, it still won't run most of the games that wouldn't run on my Atari 400. Some of the games work, such as Chessmaster 2000, Frogger, and Pitfall, but others, like Lode Runner, Defender, Dig Dug (all on disk) try to load, and then stop at a blank screen. Could it be that my Atari 1050 disk drive is shot? It seems to work, but since I got a whole new computer and the same games don't run, I'm suspecting the drive. But, I suppose it could be a bunch of disk errors, but that's not too likely either. Well, thanks for your help in advance!

Try holding the OPTION key down when you turn on the 800XL
It has internal basic that might need to be disabled. If that fails
you will need a "translator" disk that will make your 800XL
run like a full 48K 800...

That is EXACTLY what they will do. Anyone notice the popularity of the rerelease of Frogger for Playstation and PC? Hasbro is going to revamp and rerelease some of the old Atari games like Missile Command in similar fashion. I wouldn't expect to see a new atari-branded console from them, though. Read more in today's Wall Street Journal, by the way. Good story about the deal that even mentions retrogaming's current popularity (it talks a little bit about the MAME arcade emulator in there).

Nor a floppy disk drive :-)
Let me clarify my statement about "cheap" design. The ST family of home computers was not revolutionary: basically it was just a 68k computer running a modified version of Digital Research OS. The software was not new. The concept was not new either (Apple Lisa and Macintosh were the first commercial implementation). The hardware was not new (Motorola 16/32 bits microprocessors were first introduced in 1978 if I recall correctly). What really made these computers interesting was the price. Thus, it was the cheap design that made their commercial success.

At the time, Sinclair had been producing a multitasking (even if it was just task switching, really) computer running a windowed environnement on a Motorola 68008 (8/16bits microprocessor). The machine had its share of problems (mostly production) but it was more or less an ST-like, only introduced years earlier. It was low-priced, too.

The Amiga had just been introduced. It was basically the same design as the ST, only with the technical edge given by the specialized ASICs and the true multitasking environnement. (Jack Tramiel's) Atari had forked $1 million (or was it 10?) to help it's development. Commodore offered more money than Atari (by an order of magnitude) to buy the design. This other Atari failure forced them to create the ST.

> I suspect that what happened with the ST is that since Amiga was slipped
> out from under Atari by Commodore, they wanted to have a product to
> compete, and wanted to get to the market at or before the Amiga made it
> so that they would have a fighting chance.

Yes exactly. But Atari didn't ever catch up with the Amiga technology. It had it's share of success (mostly due to the popular MIDI interface and cheaper price tag at the begining of the ST life), but the Amiga became slowly more popular after the Amiga 500 was introduced.

The point I'm trying to make is that, for the first two years, Atari sold a lot more STs than Commodore sold Amiga. They had the money to evolve the ST and to create radical new designs. They had the market advantage. They didn't use it to get the technological edge. They just created cheaper designs when they were in the position to revolutionize the computer industry.

I kinda viewed this announcement as a bit of a dissapointment... I'd hoped
that maybe Hasbro would do something a bit more constructive than gut what was
left of Atari for it's decade plus old licenses... Although if Atari's going
to be gutted, at least it's not at the hands of the Tramiels...

The price for SRAM here in the US is about the same as you mentioned in
your post $5 - $6 dollars for 128kb. This is expensive when you can buy a 1 meg
DRAM for $6.00 though. You know we have alot of cheap people. I am also looking
into using Flash Ram to do the job. The cost of these are even more expensive the
SRAM or DRAM.

Indeed. I can't remember the details but you poke the beginning of the
basic carts error trap code (probably in Mapping the Atari) into the reset
vector and then put a trap statement in your basic prog. When you hit
reset, it jumps to the trap line in the program. never failed for me.

Like what? All the Atari hardware is ancient and would look totally silly
if they dtried to do anything with it. The titles and patents are the only
useful bits they bought. I used to love Atari as much as the next nut but
I'm realistic about what they became after the initial rush of the early
80's.

FWIW, I've owned 2600/400/800/130XE/STm/STe/Mega Ste/Falcon/Lynx/Jaguar
and shit loads of peripherals so I'm not shy about buying their stuff.

So Hasbro bought Atari for the games titles, and their first effort will be Centipede for the, umm, Playstation, wasn't it. Hmmm... it will be interesting to see how profitable it is. Nostalgia is big business. Keep an eye on the new VW Beetle.

Hasbro really got a lot of stuff for their 5 million. Centipede, Dig Dug, Asteroids. Did they get Donkey Kong and Defender, too?

They are not going to resurrect any hardware though, I bet. Maybe they could do something with the Jaguar, but I doubt they will.

: That simply isn't true. The Atari ST was a cheap design. It was designed too
: quickly with no real innovation (try to think about the Sinclair QL, which
: was almost the same design and was produced 2 years before, or about the
: Amiga which was first introduced as a prototype a whole year before the ST).

Absolutely. The ST and TOS were designed, built/programmed within one year.
The guys from Atari just used a user-interface written by Digital Research
for the PC and wrote a kind of MS-DOS-emulator they called GEMDOS.
The Amiga for instance was far superiour both in hardware and in software
design. The Amiga OS was fully pre-emptive multitasking, had dynamically
loadable libs (or something like it), etc, etc. The hardware for graphics
and sound was also a lot better (DMA stereo sound, hardware sprites, fast
blitter, more colours...)
The main things that made the ST series still sort of a success were the
built-in MIDI ports, the ability to use a nice monochrome-monitor and maybe
the MS-DOS compatibility (diskwise)...

I was watching CNN this morning (3/17/98) and saw a brief on the Hasbro purchase of Atari. The news blurb stated that Hasbro bought the rights to have 75 game titles so they could re-release them as part of the "retroware" stuff (ala Frogger, which they sold 900,000 copies of).

Hopefully they do something more then just the retroware, but it would be cool to play some of the old games again (I wonder if they'll keep that stupid bat in Adventure that used to drive me nuts).

Lets see... The story is from, I believe, Video Games and Computer Entertainment. When Atari came in, the Lynx was still nothing but a bunch a hand wired boards connected to an Amiga. Nothing was done in the way of prototypes, figuring out battery usage, nor where to get color LCD screens. Atari originally was just helping Epyx out with the idea it was going to be join project but once it appeared that the project wasn't going fast enough, Atari bought the Lynx from Epyx out right and finished the project.

Amiga was a 16 bit equlivent to the 8 bit 800. Both designs involved
thework of Jay Minor, he pushed for a 16 bit design. Amiga development
stalled
because projections showed that the cost of completing the development
was too high and simply no one was willing to risk taking the plunge.
The Amiga wasn't "slipped out" from under Atari, it sat idle for a
significant
time. Jack Tramiel brought the design for the ST. with him from
Commodore
and that is what Atari developed. The Amiga company was later acquired
by Commodore and development was completed. Initially Commodore withheld

information about the operating system to insure their ability to
maintain
control over the computer, but this had the undesirable effect of

slowing
sales due to the small software base.

The Tramiel philosophy was "Power without the price" Tramiel wanted to
bea business success not lead the technological front. Again he said
"Business is war!" I don't necessarily agree with this philosophy but
that is how
Atari was handled.

2991. Re: Assembler Editor Cart via Emulator

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-17 00:00:00 UTC
From: bostone1@aol.com
Message-ID: <19980317152001.KAA14027@ladder01.news.aol.com>
Source record: 64626

I've done this. The Assembler Editor cart is an 8K cart that can take the place of the ataribas.rom file. If you boot up your computer with Atari DOS 2.5, for example, with the cart installed and go to the DOS menu, you can use the K option (I think that's the one...) to save the binary image of the cart to a disk file. The rom goes from A000 to BFFF I think. Anyway, you transfer this 8192 byte file to your PC, rename ataribas.rom to ataribas.bak or whatever, rename your AssemEd cart file to ataribas.rom, and start xformer. Where you would normally have BASIC coming up, you get AssemEd.
I use a batch file called AssemEd.bat that starts out copying the AssemEd image file to ataribas.rom and then starting Xformer, then copying back the ataribas.bak to ataribas.rom upon exit. I hesitate to add that I've done this with Atari Pilot too.....
By the way, I once tried this with Microsoft Basic and Logo, both 16K carts, and it didn't work with version 3.6 of Xformer. I don't know about the latest versions of Xformer though.

I gather from his morning's collection of articles here, that Hasbro has bought Atari, and that the deal specifically mentioned the 8-bit computers (among other things), and that for the amount of money involved Hasbro "must" be planning to "do something significant" with the technology.

Is it possible there could once again be paying jobs for Atari 8-bit programmers, someday soon? Wouldn't THAT be a kick? :-)

It isn't so much nostalgia as it is playing under used game concepts. Mario
has been with us since 80 or 81 and yet they manage to keep that character up
to dated.

>
> Hasbro really got a lot of stuff for their 5 million. Centipede, Dig

I think Dig Dug is Namco. Donkey Kong is nintendo, and Defender is midway.

Actually, all computer games are 2D because the CRT has a disply that
is is only two dimensions. In order to be true 3D, one would have to
use one of the available stereoscopic methods like LCD shutter glasses
and such with it.

Hehehe.

Amen.

Personally, I think it was a price point that made the difference.
The C64 was cheaper, and to many buyers of that era, they saw no other difference.

Is it an Atari with a 65816 instead of a 6502 or both? Can the 65816 just run things faster or is it different? (besides being 16-bit)

3004. SIO status command

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-18 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <6ep65e$u6o$1@dartvax.dartmouth.edu>
Source record: 64389

I'm playing with a program that acts as an SIO2PC server under Linux,
and it seems to work fine for single-density disk images, but it
doesn't like double density disk images. I've noticed that the Atari
is sending some status requests to the drive, and I'm not exactly
clear on how my program should be responding. I seem to have the
handshaking and checksumming down, but the 4 data bytes are a mystery.

No, that cannot be theoretically possible because the Phosphers on the CRT must be a few molecules thick, hence they are 3D, therefore the 2D game is really 3D. My theory on this would only make sense if you are a cheap skate video game company trying to make money by calling 2D games 3D. I wonder if it could be argued in court ;) Think of it this way most CRTs are not flat, they are rounded meaning they are actually 3D. The phosphers must be 3D anyway you put it because they have some height width and depth. Therefore the phosphors are 3D. If you display something on 3D it must be 3D. The CRT itself is also not flat, the electron gun sticks out the back, but relating the fact that a 3D setup is projecting images than the image must be deduction be 3D. Pretty interesting theory isnt it? Now I need someone to argue the 1D games for me...

Just dandy. The rights to most of the classics now belong to the same people
who shat upon the once-respected name of Frogger while "updating it with the
latest technology."

Oh, my cup runneth over.

jeff. Updating classics can work (cough cough T2K), when
it's done _right_. Hasbro doesn't have a clue how.

Here in the US the thinking at the time ran along the same lines that
purchasedecisions that had been used for VCR's. The reason that VHS
became the
popular format was due to cost/hr of the tapes and the length

VHS was 6 HR, Beta was 4.5 hrs and more expensive.
The Commodore was made from cheap parts and was less expensive and came with basic built in. It was 64K and cost less. More K less money meant buy that one.
Bad decision here however since the large majority of C64 had to go back to the store
after being opened. I personally checked out repair rates at a number of sites and found
that they typically had a minimum of 15 C64 to one Atari. (if that)
(I am an electronic technician and asking about the repair situation was easy.)
The C64 was assembled from cheap parts and the OS crashed software.
One freind of mine is a QA tester for digital. He has tested the C64 out of
curiosity and found weaknesses in context switching. The system does a poor job
in cleaning up after itself and so things like GEOS will crash after you change applications.
(Ok sometimes you MIGHT get lucky and have it sucessfully work 2 or 3 times) Typesetter for
the Atari you could go back and forth at will between the 3 apps for hours.
Online BBS systems would be up for 5 years at 24hrs-365days for Atari. 6 months for C64
Everything points to inferior parts and poorly designed OS.

You could use any portable TV with A/V inputs (I have a 2" B/W (tube)
and a 3.3" LCD)

Patrick.

If you put the correct value resistor in series with the A and C
buttons
you could read the changed value when the button was pressed, but I
have never seen software to take advantage of this (yet)

BTW pin 7 is the +5v on the Atari

Pat.

Speakerphones do exist, but many of the items you see on TV (that at the
time
appear to be cutting edge technology either don't really work or don't
work as well
as depicted (unless you looking at an older show)
Back to the future II had "hoverboards" and someone spread a rumor that
people
were using them in California. The miracle was accomplished with a real
Skateboard
under the actor that was out of the picture or by suspending the actor
by wire from a
crane, or by other means. Fortunately for you the speakerphone of today
work fairly
well...

---
you probably need to set $2EA to $60 when the system executes a Status
command. This indicates a DD drive. An $80 indicates an ED (1050)
density drive. The drive actually sends the controller status and stuff
during a Status command. You may need some of that for copy protection
things....

Bob

3020. PLEASE HELP! I'm trying to get my 800XL up & running!

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-18 00:00:00 UTC
From: bg176@freenet.buffalo.edu
Message-ID: <EpzqJx.oI@freenet.buffalo.edu>
Source record: 64457

Hi guys! It was with great relief that I found this newsgroup! I have an Atari 800 XL at home with a 1050 drive, which used to use DOS 2.everything works fine, but I have no hard software whatsoever. The only
thing I can use is Modemlink, which came with the modem (which works as well). I have been to the Michigan FTP site which has the old Atari files, but I
seem to be running into a brick wall here. I am using an older IBM XT now as I write this, and have gotten some of the software. I have gotten MYUTIL.EXE to work on this PC, and can format and read and write files

I would now like to get a terminal program working (preferably VT100 compatible)
and have downloaded icet800.arc. Here is where the problem starts. The
file is compressed of course in the ARC format. So are all of t
DOS and file programs (such as DOS 2.5 or FILESEL).

What should I do next? Most of the un-archiving software is in ARC format, so I can't use that yet.
And, since I don't yet have a disk that will run DOS on startup (my Atari's
startup that is), how can I create a disk with my PC that will allow me
to boot up the drive on the Atari when I turn it on?

It seems I have to find a way to uncompress one of the DOS's with my
PC and then write it on to the Atari-formatted floppy with MYUTIL.
Am I barking up the right tree here? Well, if any of you have any
suggestions, please post or email me at bg176@freenet.buffalo.edu
If you know of any websites where I could download an uncompressed version
of DOS 2.0 or 2.5, or an uncompressed version of an archiving utility,
please let me know. Thank you for your help!

Jacob

$7.50

JUMBO JET PILOT from Thorn EMI, manual.
VG++/VG++
$10.00

K-RAZY ANTICS. from K-Byte, manual. Rare
NM/NM
$15.00

K-RAZY SHOOT-OUT. from K-Byte, manual. Rare
VG++/VG++
$15.00

MILLIPEDE from Atari, manual.
New (shrinkwrapped)
$10.00

PENGO from Atari, manual.
VG+/NM
$7.50

POLE POSITION from Atari, Manual.
VG++/VG++
$7.50

POOL 400 from IDSI, manual.
VG++/VG+
$15.00

Qbert from Parker Bros. Manual.
VG++/VG++
$12.00

QIX from Atari. manual.
VG++/VG++
$10.00

STAR WARS: RETURN OF THE JEDI-DEATH STAR BATTLE from Parker Bros.
Rare
NEW(shrinkwrapped)
$10.00

RIVER RESCUE from Thorn EMI. No manual.
VG++/VG++
$5.00

ROBOTRON 2084 from Atari. manual.
VG++/VG++
$10.00

SOCCER from Thorn EMI. No manual.
VG++/VG++
$5.00

STAR RAIDERS from Atari. manual, The box has been slightly crushed;
The cart and manual are mint.
VG++/NM
$10.00

SUBMARINE COMMANDER from Thorn EMI. manual.
VG++/VG++
$10.00

TENNIS from Atari.
New(shrinkwrapped)
$7.00

WIZARD OF WAR from Roklin. manual, no box.
VG++
$6.00

Carts only:

==========
FLOPPY SOFTWARE: Assume a box unless stated otherwise.
==========

A.E. floppy from Broderbund. Stamped Dealer Demo, not for resale. In a
Broderbund dust jacket plus manual. No box
$2.00

ACE OF ACES from Accolade. 1986. 5.25" floppy plus manual. No box.
Works with 800/xl/xe
NM
$4.00

ACE OF ACES from Accolade. 1986. 5.25" floppy for 64k memory
including XL, XE. Manual, warranty card.
VG++/NM
$7.00

ATARI SERIES; GAMBLER from Keypunch Software. 1985. 4 games:
Blackjack, Poker, Slots, Derby Days. Instructions on disk. Plastic
bubble box cut open at top.
VG++
$5.00

ATARI DOS 2.5 plus manual. No box.
$5.00

ATARI WORD PROCESSOR. Model CX404. Huge Easel-back Notebook. Contains
2 floppys, training manual. No box
VG+
$15.00

ATARI XM301 MODEM manual with XE TERM COMMUNICATIONS SOFTWARE. 1985.
Spiral bound 50 page manual plus 5.25" floppy. No box.
NM
$7.00

ATTANK. by Joel Glick. Atari Program Exchange. Floppy plus manual. No
box.
VG++
$4.00

BILL BUDGE PINBALL CONSTRUCTION SET from EA. 1982. 5.25" floppy,
manual.
VG/VG++
$7.00

BEACH-HEAD by Access. 1983. 5.25" diskette plus instruction card. No
box.
NM
$3.00

CROSSFIRE Floppy Disk in official dust jacket plus manual from ONLINE
SYSTEMS (later became Sierra OnLine). No box.
VG++
$5.00

DRAGONRIDERS OF PERIN from Epyx. 1983. 5.25" floppy plus manual. No
box.
VG++
$3.00

DUNJONQUEST: TEMPLE OF ASPHAI. 1981 Automated Simulations. 5.25"
floppy plus manual command card, and loading instructions.
VG/POOR
$5.00

DUNJONQUEST: UPPER REACHES OF ASPHAI. Expansion kit #1 for Temple of
Asphai. 1981 Automated Simulations. 5.25" floppy plus manual and
loading instructions. Also includes photocopy of Temple of Asphai
manual and help guide. No box.
NM

$4.00

THE E FACTOR Floppy and manual and box from Cosmi
$3.00

the EIDOLON from EPYX and LUCASFILM. 1985. 5.25" floppy, manual. Some writing with a pen on back of manual. Requires 64k. Flip side of disk for Commodore 64.
GOOD/VG
$7.00

EMPIRE OF THE OVERMIND from Microcomputer Games, a division of Avalon Hill. 1982. 5.25" diskette, instructions, plus THE RHYME OF THE OVER-MIND booklet, a beautiful blue onion skin of 8 pages plus cover.
No box
NM
$7.00

F-15 STRIKE EAGLE from MicroProse. 5.25" floppy (C64 version on flip side), manual, box.
G/VG++
$7.00

F-15 STRIKE EAGLE from MicroProse. 5.25" floppy (C64 version on flip side), manual, no box.
VG++
$5.00

FAMILY FINANCES 1 & 2. Official Atari release on 2 floppys. User's Guide included. No box.
VG+
$2.00

FIGHT NIGHT from Accolade. Complete.
VG++/VG++
$5.00

FLIGHT SIMULATOR II from SubLogic. 48k memory. Two 5.25" floppys, Flight Physics manual, Pilots Operating Handbook manual, reference card, 2 maps, release notes.
VG/VG++
$7.00

FONTEDIT; IRIDIS 2 from The Code Works. Cassette tape,56 page manual.
SS(shrinkwrapped)
$5.00

GALLAHAD AND THE HOLY GRAIL. by Douglas Crockford. Atari Program Exchange. Floppy plus manual. No box.
Good.
$4.00

GAUNTLET from Mindscape. 1985 for 800, XL,XE 64k. 5.25" floppy. No manual. Colorful cartoon-lke folder/box.

VG+/VG++
$5.00

GETTYSBURG; THE TURNING POINT from SSI. 1986. 48k required.
New (shrinkwrapped)
$15.00

GREAT AMERICAN CROSS-COUNTRY ROAD RACE from Activision. 1985.
Instruction card plus diskette. Works with 800/xl/xe systems.
VG++/VG++
$4.00

LEADER BOARD DUAL PACK. from access. 1987. Double sided floppy,
manual. No box.
VG++
$5.00

MICKEY IN THE GREAT OUTDOORS. From Walt Disney Personal Computer
Software. in Dust Jacket, plus manual and box. The box is about 8x10",
plastic, with Mickey on both sides (and as with many games from this
period, is the best part of the package)
NM/NM
$7.00

POGO JOE. Screenplay. 1983. Arcade action. Both 5.25" and cassette
tape for both Atari 800 and Commodore 64., manual,
NM/NM.
$4.00

PREPPIE II. Floppy plus very colorful manual, plus very colorful
plastic box.
VG++/VG++
$7.00

REALM OF IMPOSSIBILITY by Mike Edwards from Electronic
Arts.......Floppy plus box (10" flat square box) from Electronic Arts.
VG++/VG++
$7.00

ROMMEL; BATTLES FOR TOBRUK from GDW and EA. 1986. for 48k or XL, XE.
5.25" floppy, rules manual, historical manual, loading card, reference
card, warranty card, quick reference card, 5 maps.
VG++/VG++
$10.00

THE SANDS OF EGYPT from Datasoft 1982. 5.25" floppy plus 4 page
instruction card. No box.
VG++
$3.00

SEVEN CITIES OF GOLD by Ozark Softscape (Electronic Arts). Floppy,
complete.
VG++/VG++

$7.50

==========

Here is the way I grade software. There are seperate grades for the
box first, and what's in the box second. For example, VG++/NM would
mean the box is VG++ and the contents of the box is near mint.

Shrinkwrapped (ss)
Self-explanatory.

Near Mint (NM)
This is the highest grade for an unsealed item.
"Mint" is not used as a grade because, without a
microscope and 40
minutes of inspection, perfection cannot be verified
to
everyone's satisfaction. Near Mint ranges from
appearing unused, to an item that may have been used,
but is
without a notable cosmetic defect as evidence of that
use.

Basically, a NM/NM package should be a reasonable
simile to a fresh, unused
copy.

Very Good Plus Plus (VG++)
This grade refers to an attractive,
fresh-in-appearance item that, upon closer
inspection, has been disqualified from the NM
category due to (usually)
one flaw that could not be overlooked.

For boxes, this includes: a small split of the seam;
some clear tape on one corner.

Basically, and this includes the contents of the box
as well, a VG++ item is qualified by having a
noticeable, yet functionally insignificant defect that
verifies that the item has been used. A VG++ item
appears neither blatantly
second-hand, nor does it have the sparkle of
"brand-new".

Very Good Plus (VG+)
This is the broadest grade serving as a catch-all for
any decent, presentable,
average, usable (not marred or defective) item.
People ordering VG+ items
usually are prepared to accept an imperfect item
representing the artifact
that it is, and are going to enjoy it without being
excessively preoccupied
with cosmetic details. VG+ is a fine copy that is
indisputably "used", being
your basic "decent used package" for utilitarian
purposes.

Boxes and contents will have some combination of one
to a few of the following
defects:
partial seam split (with or without clear tape
repairs), minor dirt ring,
some minor warping due to moisture, a creased
corner, small squishing of the
box.
The box and contents must be free of major
defacements, and will certainly not have ALL of the
preceding minor ones on the same piece!

Very Good (VG)
This is the beginning of "rough" for collector's
purposes. A VG record is
usually one that a collector will buy to fill a
"hole" in his/her library until a better copy
comes along. We usually don't advertise items with either VG
covers or discs unless they are deemed scarce enough
to attract a collector
for this purpose.

Good Plus (G+)
Averaged between VG and G,

Good (G)
Items graded "good" are very used and only
presentable to the least
discriminating collector. This classification is
usually employed for

boxes when it's the contents that's worth collecting,
and vice-versa; or when
the component in question is so very rare that its
existence in any condition
is regarded as manna from heaven. It should not be
confused as referring to "Good" COLLECTIBLE

Fair (Fr) or Poor (P) or Missing Component ()
For advertising purposes, if either box or contents
is either Fair or Poor, we
treat it as functionally missing , and we have graded
only the component
that is G or better, essentially selling that
component "as is", theoretically
without its decrepit companion. In these cases, the
grade should include an
asterisk in place of the Fair/Poor cover or jacket to
reflect its effective
absence.

Supplementary Notations
Condition augmentations: there are some common
exceptions to the overall
condition of an item that merit independent notation
from the
overall grade assigned, rather than being "averaged
in" as with standard
gradeable wear. These are usually after-production
aberrations courtesy of
the record company such as:

Writing on front cover, back cover, label, tape
on seams or spine,
water damage (especially if it's growing "hair"),
applied era "pop-culture"
stickers (such as "right-on" with fist) etc.
These minute details are usually only noted on
rare and expensive items.

There is no "Select" button on a Genesis pad. Only "Start". I understand what you're saying about buzzing out the A and C buttons, but the 6-button pad also has X-Y-Z.

Actually, there is only one reason Commodore 64 did so well. And it had nothing to with its 8 sprites, or its SID chip, or its unbelievably slow disk drive. It was the horrible 1200 XL. As I recall, Atari execs were debuting a 1200 and its power supply started smoking durig the demo. Everybody heard about it at the time, but this fact seems lost to most. This is the only reason the C-64, became so popular. Let's get real, why would anyone have bought a C-64? It had zero software for it. Atari had all of the current arcade releases as well a large number of excellent business, education, and program software for it. Nothing more than simple quality control. Funny that everyone points at the C-64 as being poorly assembled, at the time the Atari was worse.

(Btw, I agree the ANTIC bites in the way it handles text.)

3027. Trenton Computer Fest

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-18 00:00:00 UTC
From: Robert S Ely <rely@ix.netcom.com>

ALL:
Just wanted to post that the Trenton Computer Fest (West Winsor, NJ)
will be held saturday and Sunday April 18th and 19th. Addmission is
$10.00 for both days for adults, $5.00 for Sunday only, Children under
12 are FREE on Sunday if acconpanied by an adult. Students with ID and
Seniors are $5.00 for both days.
I will be hosting the Atari 8-bit forum on Sunday starting at 1 PM.
You'll also find lots of great 8-bit finds in the TCF flea market. I've
purchased complete systems (130XE and XF551) for less than $30.00. The
great part is that everything I've purchased there has worked!
The show has over 1000 flea market vendor spaces, over 400 indoor
vendor spaces, over 100 seminars, forums and talks, Keynote speaker
Festival Dinner with LOADS of great door prizes (I once one a CD-ROM
drive which I use regularly!).
This year there will be an Internet Cafe and selected seminars can even
earn you CEU college credits!!!
For more info contafe the TCF web site at http://www.tcf..net, or
1-215-957-4000. For vendor indoor or outdoor space reservations call
VOICE:1-717-786-2260, FAX: 1-717-786-4882 or E-Mail: wlemon@voicenet.net

Hope to see you all there!

Jacob,
Let me suggest first that you get a copy of A.P.E. and the appropriate SIO2PC or APE cable. Also d/l a few uncompressed .ATR files. With this setup, you will be able to get the files with your PC then transfer them directly to your 8-bit system. Locate a copy of Discommunicator 3.x, Super Archiver and un-archiver (try the Atari archive at UMich). You'll be in business in no time at all with these few things!!!

In addition to playing on commander level, watching your energy and not losing any star bases, speed is also important, you need to finish in around 7 time units to get the Star Commander Class One rank. The one thing I wish I could change in Star Raiders would be to allow you to switch back and forth between the galactic chart and the front/aft views after completing the game. That way you could see exactly how long it took you to complete the game.

A good tactic towards completing the game faster is to let the Zylon craft approach you from behind, with you travelling at speed 6 (press 6 on the keyboard after arriving in the sector). When the enemy craft first come into range, they will be just a spec on the aft view screen. Fire a couple of photons at them and then you can "guide" the photons towards the enemy by moving the joystick. Let the photons drift out towards the enemy, and quite often you'll be able to destroy them without them even getting close to you. One thing to keep in mind is that you can only have 2 photons on the go at any one time. Fire a third and the first one will disappear, fire a fourth one and the second one disappears. So when trying the above, wait until you're sure the first two photons missed, and then wait a little bit longer than that before firing the next two (unless of course you've got an enemy shot/craft coming at you full speed, in which case tactics change). Once you've done it a few times, repeating the process gets a lot easier. I've always thought it a nice touch the way that you first see the explosion and then a little while later hear the sound when you do this (even though sound *doesn't* travel in space ;)

Another note is that you can't destroy the flashing enemy ships this way (they've got shield too!), you have to let those get close before you can destroy them.

You can also try taking a shot at the enemy craft when you first engage them with the front view and you've got them coming at you full speed. Line them up in your sights and fire away. This can be dangerous though because they often use the same tactics (resulting in you getting a face full of enemy fire).

Other useful tactics for finishing the game quicker is to use the hyperspace engines for jumping long distances within a sector - hit H, switch to long range scan and steer your ship towards the target. Don't forget to abort the jump before you reach jump speed (hit any number key). This is both quicker and uses up less energy than doing it with the conventinal engines (by hitting 9). And don't dock at your star bases too often as it takes up precious time, you should be able to finish the game docking just 2 or 3 times, 4 max! There are one or two other thing you can do.. but mainly, you've just got to be good, so practice, practice, practice!

3030. Cloak & Dagger? Ever released?

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-18 00:00:00 UTC
From: followell@dynasty.net
Message-ID: <350fc7e4.143669194@news.supernews.com>
Source record: 64467

Does anyone remember the early 80's movie Cloak & Dagger. Was
the game of the same name, shown in the movie, ever really released on
the 5200 or the 8 bit?

Sincerely,
- Byron Followell
followell@dynasty.net

Ermm, either your insane, joking or just plain weird.

Do you really think the entire world knew about this incident or even
cared? The C64 was a success for various reasons, a single incident of a
smoking 1200 power supply isn't one of them.

Good writers do not "avoid the use of italics." That is silly. Maybe you mean they avoid overusing them or something.

As for the use of HTML, I guess I was for it because webTV reads it well. If I were still using Agent I guess it would be tiresome. I suppose it is a "violation of netiquette." So, perhaps I was wrong.

Maybe soon, text-only newsreaders will be revised to ignore the html tags, then we won't need to be having ths discussion.

>
>Has anyone been able to hook an Atari 800 up to a SCSI JAZZ drive?
>Please tell me how to do this.

You'd need a parallel bus interface (either XL or XE type) for this.
The 800 doesn't have that. Bob Woolley added a PBI to his 1200XL, but
that involves "a bit" of soldering and you'd have to change the OS (to
either XL/XE or like Bob W. does, write your own OS).

CU Mathy Van Nisselroy

PS I have a ZIP drive hanging from my BlackBox and it works great. It
involve soldering together a short cable (but I've seen this thingy
in Jameco's catalog that might do the trick (for 10 bucks) and a Parity PAL
(which I guess all modern SCSI drives need.

>I do remember satisfying that very concern.....

Hey, in that case you could do the same as you can do to an ST mouse to get the right mouse button working. Just put a resistor parallel somewhere don't know where right now and I can not look it up either. Same goes for the value of the resistor, but the paddle value should drop below 9 if the button is pressed.

I know it's a wee bit off topic, but....

Anybody remember those stand alone speakers every private detective in every detective series on TV had 10 to 20 years ago. They'd get a call, pick it up, push on some box and everybody in the room could hear and speak to the person(s) on the other side.

I'm looking for a schematic for this stand alone thingy. Who can help me?

Why not buy a now speakerphone? They are either to expensive or of poor quality (I guess).

Actually, there was no "smoking gun" or inyour case "smoking power supply". The 800 was well established when the C64 came. During that time almost any system that came out got games for it (Colecovision, Atari 2600, 5200, 800, Intellivision, etc..). The C64 became more succesful for 3 reasons:

1. With the 800 being established the pirate scene was very mature and Atari had a bad reputation.

2. Commodore established a policy with software developers that inorder to develop for the C64 they had to sign a 5 year agreement and produce software for it. This is one reason the software life of the 64 lasted so long casue the priate scene on the C64 matured very quickly.

3. The Commodore was cheaper and sold units faster than the Atari.

I worked for a company that sold C64's. The disk drives and C64 power supplies were terrible. We had to ship back an entire shipment of 1541's once.

OK, I'd like to update the Atari 8-bit cart list with these new carts that are coming out, but I still haven't been able to determine if these are legit or pirate. It wasn't that important to me when only protos were being burned, but now some regular releases are also getting copied.

1) Who is burning these new carts (i.e. who do I list as the manufacturer)?

2) Do they have license agreements from the copyright holders to do so?

3) Are some of these really new releases, or ROMs of disk based games, or European releases, or shareware/freeware or what?

Here is the current list of titles I am trying to figure out the legitimacy of.

Amaze Maze
Bumpers
Checkers
Hearts
Jailbreak
Lights Out
Ma Jong
Montana Solitaire
MyDOS 4.X developed by Woodmark Systems (Charles Marslett & Robert Puff)
Paddle Pack Pong
Paddle Wars
Ricochet
Rocks is this the game from ANALOG magazine?
Sharp Shooter
SpartDOS 3.3C FTe last held the license
Track & Field Atari game, B&C currently burning copies
Twin Pack Games
Video Poker by H. Brown
Video Slots

Agreed. The Usenet has got by quite happily for 15 years or so by using
basic tricks to highlight words you want to *stand* out.

When you read a novel, is it full of fancy fonts, italics, colour and so
on? I doubt it. Do you miss those things? No. Why? Think about it.

When I see a newsgroup message done in HTML (or even e-mail done that way) I figure it's going to be a commercial message. Often it isn't. Just to bolster your arguments against using it, think of this -- I edit a disk-based, user group newsletter that uses the normal 8-bit screen font and only puts names in all caps so they will stand out. The style was established many years ago, and I saw no reason to change it when I took over in 1996. I can count on the fingers of one hand the number of times somebody has reported misunderstanding an article.

And to think that this thread was started as a reaction to somebody who posted a message in HTML BY ACCIDENT ...

3048. The new MyDos 4.5 cart

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-19 00:00:00 UTC
From: tikk@alt.anonymous.messages
Message-ID: <351082f2.5345990@news.nowhere.net>
Source record: 64407

Here are my impressions and the text from the new MyDos 4.5 cart.

First, is it worth the money? I don't know.

The software comes in a standard 16k Atari cart (like basic) with
a paper label taped to the front. There are 2 2764's in the cart.
Anyway, this means you can't stack it and because you have to hot
unplug it after booting, no other cart can be installed. Actually,
other than the fixed MEM.SAV (I seldem ever used it in the first
place), it is a pain to use. I just don't like the idea of pluging
in then pulling out the cart over and over if something locks up.
I thought I was going to be smart and copy the system to a disk
after I formated but after rebooting I got a screen full of junk and
an endless reboot attempt. You have to boot from the cart then pull it
unless I'm doing something wrong.

So if you were thinking about getting this cart, you might want to
think it over. Twenty bucks isn't much and if nothing else, it's
another item to add to the collection.

Oh, it only works on XL/XE's with 64k or more ram.

==========

MYDOS 4.5 ON CART

Since this cartridge based MYDOS is different than the
standard MYDOS a few words on the main differences is
in order. The differences include a reverse OPTION key
function at power up. Now if you want BASIC you must
hold down OPTION at power up. Another difference is the
Ramdisk configuration tables. The available bank bytes
are ordered from highest to lowest value which is more
compatible with the XE standard banks. The default
configuration is also in this highest to lowest order
such that a novice is less likely to blow his Ramdisk
away without wanting too!! To configure your Ramdisk
to not use the BASIC/XE banks choose page sequence 1
as per the MYDOS technical manual.

Another difference is a working MEM.SAV feature. I
don't know why MYDOS was released with a defective
MEN.SAY in the first place but it is now working. If
you are sharp you will notice that DOS.SYS has grown
by one sector and DUP.SYS has shrunk by one sector. The
code for the MEM.SAV feature was moved back to DOS.SYS
which is the only place it could work from and thus the

different sector counts. The purpose of the MEM.SAV feature is to allow the user to preserve the portion of Ram that DUP.SYS loads into. It is used for producing modified files that would normally be stomped on by DUP.SYS. When the MEM.SAV feature is active and DUP.SYS is called to be loaded into memory again, a copy of the area in question is saved in the file named MEM.SAV. When a (K)SAVE is used for that area and the MEN.SAV feature is active then MEM.SAV is loaded into the area prior to the (K)SAVE. MYDOS's MEM.SAV feature is actually quite a step above other DOS s MEM.SAU in that the feature can be deactivated by simply choosing the (L)LOAD memory option and then pressing return. You don t have to put up with constantly loading and reloading MEM.SAV or deleting a MEM.SAV you would really like to keep, it can sit on your disk unchanged until you need it. To activate MEM.SAV you use the (N)LOAD memory w/MEM.SAV option. These two functions are identical in every way except (L) turns off the MEM.SAV flag and (N) turns it on. In either case no file actually needs to be loaded, just a return will toggle the flag.

The last difference is probably the most noticeable and that is some of the menu prompts have been changed to reveal their purpose more clearly. (N)LOAD memory w/MEM.SAV is one. Set D:#/Subdirectory lets you know that here is where you can set your default drive number or use a Subdirectory as your default drive (D:). A Subdirectory CAN be used as a drive, but first one must be created by (Q)MAKE Subdirectory and then your files are copied into that Subdirectory by using (C)COPY files.

To use the cart, just plug it in and turn on your computer. You don't even need any drives to have this DOS but that really doesn't make much sense to do. The fastest boot time will result when you have two drives (1 and 2) turned on. A disk does not have to be in either drive, hut to take advantage of the built in Ramdisk loader it is necessary to have on a disk that has been formatted by this version of MYDOS, a Subdirectory entitled RARDISK:. The files you want loaded at boot up are then copied from the Subdirectory RAMDISK into whatever Ramdisk # you set when you formatted the disk. If the Subdirectory RAMDISK: is not found on Dl: or is empty, then you will get a ramdisk format and DUP.SYS copied to the ramdisk only if the ramdisk # was set when you formatted the disk in the drive. If there is no disk in the drive then you do not get a ramdisk format or DUP.SYS copied to the ramdisk, you have to do all that from MYDOS proper.

To get BASIC you just hold down OPTION at power up. A second is almost a second too long. Your ramdisk can be loaded or at depending on what you have in Dl . When the DOS menu appears stable, press RESET to enter BASIC with the Miami Valley

ACES s WEDGE program already installed!! It is a DOS like shell
that operates from ASIC. The commands are listed every
time you press RESET and the wedge is still there. It can be
removed by typing KILL. From then on you have only the BASIC
Atari gave you. Entering DIR will give you a directory of your
default drive, and that drive can be changed by POKEing 1803
with what ever drive number you have. SCRATCH is the same as
delete filespec. SPRINT will send to your printer a screen dump.
SD and DD stand for single and double density for those with
drives that can switch densities. You can now read and write
as you please from BASIC.

From this DOS you can kill BASIC by (M) running at address
$1ECO. And you can also go to BASIC by (M)running at address
$1EE5. These routines may not always be there as they are not
protected, so some luck and judgement on your part is required.
Don't forget to kill your Basic with a run at $1ECO prior to
loading a program with DOS that "lives" in high Ram as BASIC is
a ROM that lives from $AOOO to $BFFF and you will lock up if there
is a conflict.

Whether you choose DOS or BASIC, just to make sure your display
list is where it should be you should press RESET when the DOS
menu appears stable. This is IMPORTANT! It allows MYDOS to be
entered correctly via DOSVEC instead of the patched entry required
to give you the option of having BASIC.

At the moment the cart is pulled this MYDOS looks for AUTORUN.SYS
on Dl: and if not there then the other features are looked for.
This was done to more closely mimic a disk based DOS. Your
AUTORUN.Sys file should NOT be a Ramdisk loader for the pending
self contained Ramdisk loader will do what it can to ruin
the previous format.

Enjoy!
POOR BOY
Video 61 BBS
612-462-3680

To load the cartridge, make sure that the power is tuned off and
that all cartridges have been removed. This version of MyDOS will
work on XL/XE COMPUTERS ONLY WITH AT LEAST 64K. Now plug in the
mydos cartridge and turn on your computer. If you want to access
basic, wait for the "pull cartridge and hit reset" command to
appear, then put one hand on your computer and firmly grasp the
mydos cartridge. Now pull it out of your computer (this will
not hurt it), then hit reset and you will be in basic. To lock
out basic follow the same commands except at boot up hold down
the option button to lock out basic.

IIRC the 65C816 is pin for pin compatable to the 6502. In its native mode it is a 16 bit processor but in emulation mode it functions as a 6502 CPU. hence the 816 portion of the name 8bit/16bit. I do beleive in the native mode it is faster than the stock 6502. Hope that this helps. There are some really good books out on the 65816 gives quiet a few details on the chip itself.

Hi folks,
I wonder if any1 has any SIMPLE working sources written for the mac65 assembler which set up the display list. I am learning mac65 and need something to study. Preferably something that is simple and takes care of business with 1 listing. The files i am speaking of will have an .M65 extender. Thanks to all of you who sent me sources previously. They were helpful but i really need something written for MAC65 so I can assemble it and debug it and play with it. Thanks in advance.

Source record: 64412

Oh come on! Who cares that Atari made E.T.? And even if you do, get a life. That game came out over 15 years ago, and anyone who was a kid when that game came out is at least out of college, married with kids. Who in the hell cares about an ancient game that sucked? And to stigmatize Atari for it? Hell, Chevrolet made the Corvair, Chevette, and the Vega, and people are still buying Chevys...

Q: What's the difference between Mechanical and Civil Engineers?
A: Mechanical Engineers design weapons, Civil Engineers design targets.

Maybe there were some old prototypes in that sale. Or maybe they don't really want
the 8 bit stuff and we could pick up the rights or a couple a bucks.

Back to reality. I thing most people still think of the good old 2600 and the fun
they had with it if they hear the name Atari. That might be good. Atari has been
synonimous with "we make great products, but let's not tell everybody" ever since.

Hasbro on the other hand is very famous (well, the products more then the company name), they are the guys from "transformers" and such aren't they?

Hmm, computers transforming into Robots???? "I'm no XE, I'm Optimus Prime." Damb, where gonna have endless discussions with our computers about the ethics of changing their Operation Systems, CPU, etc.

(Hey, maybe if you're lucky enough to have this cool (but not Brainless) Transformer, you'll be greated with "Yo dude, Check out those >beep< pictures I downloaded for ye!" :-)

>65816 gives quiet a few details on the chip itself.

The 816 is a square chip with four extra pins (ABORT, Valid Data Access,
Valid Program Access, Vector Pull). Cycle timings are identical for
65xx instructions.

It has all of the opcodes of the 65xx series, plus many new ones (all 256
opcodes are defined). 'Emulation mode' just forces the stack to be
at $000100, zero page at $000000, the flags to be configured,
things like that. Most programs will work fine in native mode.

In addition to 16-bit X,Y and A (and memory access), it also gives
a relocatable zero-page, a 16-bit stack, 24-bit linear addressing
(as well as 16-bit segmented addressing), lots of nifty new
instructions (e.g. PER (push effective relative address), PHX PLY TXY,
JSR (blah,X), long branches), and so on. In other words, it considerably
extends the 6502.

Source record: 64417

Is there any atari 8-bit emulator on the net/market that supports 9-pin
atari style digital joysticks?
(even better, is there any that supports 4 as in the Atari400/800?
(way more interresting than 100% correct sound in my oppinion))
If so, how do I build/where do I buy the interface between the
joystics and the IBM style connector?

(or is there any other way to connect them?)

Best Regards,
David H.

Does anybody knows if Atari made HD mechs into the XF551 drives??, mine can format and read without trouble HD disks, however it's very hard to exchange disks from my Xf and my 1050, for some reason my 1050 rejects the disks formated with the XF, but my XF boots any disk, even protected ones.

Greetings from Mexico

BTW: i use myutil with a HD disk drive in my PC and works great.... Of course to read the disks i use the XF....

>things....

I'm looking at things from the drive's perspective, so $2EA is
meaningless to me. What I need to understand is what signals the
drive sends back to the Atari when the Atari makes a status request
to the drive. I've noted that while the status request includes two
auxiliary bytes (they're used for sector numbers on read/write/put
commands), they seem to be set to whatever the last sector I/O was,
implying that they are probably ignored for the status request.

Right now, my program works fine emulating SD disks. When a status
request is received, the drive responds with: $10 $00 $01 $00
(along with the required acks and checksums). What do those codes
mean? Am I correct in believing that they should be different for
DD drives?

Alan, I have that information somewhere. Virtuoso Corp. visited LIAUG
many years
ago and did 2 demos. (the same meeting that I first met Jim Harris) so
that has to
be 10 years ago. They had their offices in Manhattan. I will see if I
can find the
original package (I still remember I paid $50. for it. I was club Pres.
back then
(the first time...))

The designer was the co VP. Wrote something like 100,000 lines of
assembler code
for it...

I will get together what I can and get back to you...

Pat.

The most signifcant issue when it comes to E.T. was that Atari/Time-Warner spent a huge amount of money in order to make the game (for licensing, etc...) This was just one signal that Atari's funds and future were in peril due to unwise management of the time. I don't think anyone really remembers the E.T. game, but that is the whole problem, really...

Have you noticed how hard some 8 bit games are to beat??, i mean if you go
to an arcade you will se great graphics games that any kid 5+ can beat in the
first round, Have anyone of you beaten Montezuma's revenge, jumpman junior, or
even Donekey kong without any cheat???. One of the reason i'm still stucked in
Atari is those great games........

And abundant it was for both ET and Indiana Jones. The thinking was
byWarner that "We are Atari and we will be successful in whatever we do"

And tens (if not hundreds) of thousands of buried carts attest to this
misguided thinking.
And yes I remember ET. The only interesting thing (to me at least)
was that it spoke. I always wondered how much precious memory in the
2600 was used to accomplish that....

re: HTML code in newsgroups...

Using HTML code is fine and all that if you're running a PC or
MAC. However, this is an Atari 8-bit newsgroup, and as I am
accessing this Atari 8-bit newsgroup with my Atari 130XE,
the HTML is more of a nuisance than a help. I tend to not
read messages that contain lots of HTML, as I find it to be
rather irritating. Write us an Atari 8-bit newsgroup reader
that can interpret HTML, and then you can use it all you want.

IMHO 64 sprites were better than the Atari's in the games arena, quite simply better resolution when using more colours. I used to do a fair bit of machine code programming on the Atari but only got hold of a 64 much later on when the 8 bit Atari had just about died as at the time I was looking to doing some game conversions. You just could do that little guy in Impossible Mission at the same rez on the Atari :-)

Don't worry though, I'm still a Atari fan through and through.

Mark

Howdy folks

Re: DRAM refresh

Steven J. Tucker wrote:
>
> How does all the dram in a large upgrade (like 1 meg) get refreshed?

Bob Woolley answered:

"Nope. The DRAM is refreshed by ANTIC. REF is brought up and the RAS address for the next row of memory is put on the address lines by ANTIC. This stops the CPU and refreshes memory every 2ms or so. The old ANTIC only refreshed 128 row addresses, so it could not be used by a 256K DRAM, which requires 256 rows. The larger chips require even more row addresses - quite a problem if it weren't for their hidden refresh capability. With the new chip/SIMMs, you just tell him to refresh and he does his own addressing stuff. Doesn't matter which ANTIC you use. You are close on your OS activity refreshing memory. If you cripple refresh, it is very difficult to see it fail. I used "PASSIONATELY", a demo, to test my refresh. As you watch it run, the data gets more and more corrupted.... Drove me nuts for a while!

Bob

I saw 16meg simms that could be used in the 8-bit for $50.... I'm not too excited about spending $50 for something I really have no use for, but if someone out there in 8-bit land is willing to finance the project, I'll build them a 16 meg Atari."

This is what I know about refreshing memory (gathered it in the last couple a months):

Most 30 pin SIMMs need 512 refresh cycles every 8 ms. But the bigger SIMMs need like up to 4096 refresh cycles. This kind of refresh (which is also used in the Atari, but only 128 or 256 cycles are used) is called RAS only refresh. Hidden refresh is not used much anymore. It adds an extra RAS after a normal read or write cycle (I've seen diagrams of this, it sounds easier than it looks). What is often called hidden refresh, is CAS before RAS. In the Newell 1MB upgrade (8 RAMchips 1Mbit each) CAS_not and REF_not are ANDed to get CAS-before-RAS refresh.

Problem with CAS-before-RAS is (well, maybe not in our "slow" computers) that it seems to take SIX times as long as RAS-only.

RAS-only for 1MByte can be accomplished with only three chips (2x HCT74, 1x HCT153). It's not to hard to realise this, but it's not easy to translate the schematic to text. From the looks of it, this schematic could be expended to get more than just A8 and A9 (extra address lines needed). The only problem could be that, everytime a signal passes through a chip, it is delayed a bit more.

Re: 16MB SIMMs

If you do this, are you gonna back it up with a battery? If yes, how are you planning to create the refresh cycles?

I can beat Jumpman Jr. pretty regularly. After you finish all the levels (I think it was 12) you get a little dance (similar to the game intro) and then the levels repeat randomly. Donkey Kong has no ending. The game just gets progressively harder until it reaches a certain point and stays there.

re: 3d vs 2d...

Your argument regarding "since the projecting apparatusis 3d,
then the image must be 3d" breaks down when you consider a
slide projector. When it projects an image to a theoretically
perfect screen, the image itself has no depth unless you look
at light as a particle. But so far we have not been able to
resolve the particle/wave dispute. My own idea is that it is
something _else_, that we as humans in our particular frame of
reference cannot see it as it is. Perhaps it is 4-D or more in
nature, and humand find it difficult at best to perceive more
than 3 simultaneous dimensions.

>The Canadian Curmudgeon (in cool, cloudy, Calgary)

I'm just a little bitter from what I consider being betrayed by the Trammels. After hearing so many times that 'this year' would be 'the year of Atari' only to see them only market in the New York City area or maybe a couple of other local areas, it burns me up. I tried to do my part by buying hundreds of dollars worth of hardware and software only to see it become worthless as fewer and fewer places supported the platform. I hate being at the mercy of Microsoft. But what's the alternative? Even the Mac may not last much longer. I suppose if my needs were simpler, I could get by with my old 520 ST running Word Up etc., but for my needs, it won't do. There- I got that off my chest.

Tim

Hi,
I am selling out the last lot of SIO2P cables i made. If anybody interested
please let me know.
There will be an auction on ebay but if somebody dont want to deal with
bidding just contact me directly.
The price this time is fixed at $15 and that is shipped to anywhere in the
world.
So if you need to transfer your files between a PC and a 8bit Atari - dont
waste your time - this is by far the cheapest and most reliable solution!

$2ea is the location into which the first of the 4 status bytes are stored,
so if I'm right, make the $60, $80 or whatever the first data byte of your
status response.

I've been doing the same under DOS, and have run into some trouble with
getting the SIO protocol timings right, immediate responses for the
Ack/Complete seems to overrun my 800's SIO hardware. Have you run into
that?

Now I'm reprogramming the system timer to get single millisecond timings in
DOS. The things we do for love.....

Thanks,

Greg

Message-ID: <1998032016103701.LAA21162@ladder03.news.aol.com>
Source record: 64502

Since the display list is really a program for the Antic coprocessor and NOT 6502 code, Atari assembler programs don't really do this. There's a program called Envision that will help you set up a display and then create source code to include the display in your programs. But you might be better off just reading "De Re Atari" or "Mapping the Atari" or "You Atari Computer" to understand the Antic instruction set. There's only a few to remember, so most programmers just remember what hex values do what and include the requisite BYTE statements.
All the stuff I mentioned above is available at B&C Computervisions in California. Their web page, www.myatari.com has listings of most of their inventory and the phone number for ordering.

What I did was first to look at the time values that Nick Kennedy's
SIO2PC program uses, and convert them into microseconds. Milliseconds
are probably too slow. I tried using the Unix usleep() function to
wait, but it tends to sleep much longer than requested.

What I settled on was using the Pentium cycle counter. While that
means that my program will only run on Intel(tm) Pentium(tm) or
PentiumII(tm) processors, it works quite well. I just read the cycle
counter in a while() loop until enough cycles have passed. You
determine the number of cycles to wait by multiplying the desired
microseconds by the megahertz of the cpu. (You can find out the speed
of the CPU by counting the cycles used when you sleep for one second.)

I suggest that you write the program as if you had a reliable function
that sleeps for a given number of microseconds, and then implement
that in some machine-dependant manner. That way if you have timing
problems, you only have to check the time values for the different
pauses and that one function. It also makes the code much easier to
port to a different operating system.

> BYTE statements.

I seem to remember (from about a million years ago) that you "created"
your display list from a group of BYTE statements and pointed a 16 bit
location in ANTIC to the address of the first byte.

The above is true about the number of commands (there's only a handfull)
to remember.

> "Everything is permissible"--but not everything is beneficial.
> "Everything is permissible"--but not everything is constructive.
> --I Corinthians 10:23
---
well, OK.....
at your end of the process, the bytes are CMD status, H/W status,
Timeout and unused.
CMD is the $2EA value previously memtioned. Bit 7 indicates an ED disk.
Bits 6 and 5 ($6x) indicate DD. Bit 3 indicates write protected. Bits
0-2 indicate different error conditions.
H/W is the FDD controller chip status.
Timeout is the device timeout value for CIO to use if it wants.

So, I expect you want to send a $60 as the first byte if you want the OS
to think you are in DD. OK?

Bob

It's not quite that bad. The 6510 cpu in NTSC C64es runs at 1.02MHz
while PAL C64es run at 985KHz.

I have an idea! You could...umm...play really good games from the late 70's and early 80's on them!

3111. SIO2PC for Linux!

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-21 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <6ev6fd$3b9$1@dartvax.dartmouth.edu>
Source record: 64520

You may have heard of a program called femul ("floppy emulator") that
lets you read SD disks via SIO2PC with Linux. Well, I've gone and
updated it to support reading and writing of both single and double
density disk images. It should work with all normal ATR disk images.

So if you run Linux on your PC, you have one less reason to boot DOS
now.

You can find it at:
http://www.cs.dartmouth.edu/~crow/atari/
It's at the bottom of the page: femul-1.3.c
I think after I add in a user interface I'll rename it SIO2Linux.

On the other hand, if someone else is inspired to write a user
interface for it, it might happen a lot sooner!

For now, you just list the disk images (upto 8) on the command line.
If you want to change the images, you kill the program and restart it.

Awesome! My SIO2PC device now works under Linux, supporting SD and DD
disks. There are still a few features missing, and it may get
confused if you use other devices at the same time, but for my
purposes, it's good enough. I no longer need to use DOS to support my
Atari!

If you're interested in my program, it's at the bottom of:
http://www.cs.dartmouth.edu/~crow/atari/

> how to use those .BYTE statements.

I agree. Again, if I remember corectly, you use a ORG 0x00 (where 0x00
is the address to place the display list in memory) and then place the
.BYTE statements.

```
ORG 0x400
.BYTE 0x20
.BYTE 0x20
.BYTE 0xFF
```

Now, the above (with real ANTIC commands) would be placed anywhere in
your code listing, and during your actual executable code initialization
you would load the 16 bit registers. By the way, the ORG places the
bytes at the location 0x400 (as above), so if you had other data you
wanted stored at say, 0x800, you would need another ORG statement.

>

There are a number of SIO devices which have to be the "last one" in the
chain because, like the SIO2PC cable, there is no male connector
available for extending the chain. As I recall, the 410 recorder, the
300 baud modem, from peripherals I have had.

Electrically, if you use one of the deisgns which preserves the
tri-state or open collector orientation of the SIO bus there is no
reason why an internal SIO2PC adapter would dis-allow daisy chaining.
Be aware, some of the barest bones SIO2PC cables do not have these kind
of high impedence outputs.

From the German Nord 3 teletext service (Just FYI):

(Translation below)

UNTERNEHMEN: Atari-Reste geschluckt
#
Die japanische Speilzeug-Firma Hasbro hat jetzt die Reste des
einst sehr erfolgreichen Computer-Herstellers Atari augekauft.
#
Es sei geplant, kuenftig den Namen "Atari" bei der Vermarktung
von Videospielen zu hiess es. Computer wird es von atari jedoch
wohl nie mehr geben. Atari hatte Ende 80er Jahre, aehnlich wie
Commodore, den Trend hin zum Windows-PC nicht rechtzeitig
umsetzen koennen.
#
Vor einigen Jahren war Atari schliesslich allmaehlich vom Markt
verschwunden.

Translation:

COMPANIES: Atari remains eaten

The japanese toy company Hasbro has bought the remains of
the once very successful computer company Atari.

The company plans to use the "Atari" name for marketing video
games in the future. Atari, like Commodore, failed to pick up
on the trend of Windows-based PC's in the late 80's.

A few years ago, Atari disappeared completely from the market.

A nice dream, but about as likely to happen as one of us winning the PCH or AFP sweepstakes grand prize.

Even if Hasbro wanted to do it, it is my understanding that Atari "lost" the design specs to the 8-bit chips, meaning anyone wanting to make any modifications to the design would first have to reverse engineer the original chips, which would not be cost effective. <sigh>

Too bad, as even with .50 micron technology (which is not even state of the art), everything in a 130XE should easily fit on a single small QFP chip.

Patrick Mulvey wrote:

I am also a technician, and I have seen far more working C-64's than non-working. FWIW, in the area I serviced, I never saw an Atari 8-bit computer, and I've only so far managed to locate ONE LOCAL Atari 8-bit computer owner in 13 years...even after being the VP of the local computer club! My 64 worked fine from the day I opened it after bringing it home from the store to the day it got struck by lightning. (about 8 years) In the same area I met dozens on Commodore owners.

> The C64 was assembled from cheap parts and the OS crashed software.

You know what I think? I don't think that the Commodore 64 became the most successful selling computer (and indeed POPULAR) in HISTORY by having a crashy kernel. People would have said, "Hey, this computer crashes a lot...let's buy something else." But they didn't, did they? As a result, between 17 and 21 million have been sold worldwide. I'll bet the whole Atari 8-bit line didn't sell anywhere close to that many.

> One freind of mine is a QA tester for digital. He has tested the C64 out
> of
> curiosity and found weaknesses in context switching. The system does a
> poor job
> in cleaning up after itself and so things like GEOS will crash after you
> change applications.

Why does GEOS have anything to do with the Commodore 64's kernel? GEOS is NOT a Commodore product, it is a Berkeley Softworks product. GEOS doesn't even use the 64's kernel (except to boot!) I don't think the C-64's kernel can be blamed for another products supposed poor memory allocation. I've never seen GEOS crash personally...and I own GEOS. Do you own GEOS? Have you even used GEOS?

> (Ok sometimes you MIGHT get lucky and have it sucessfully work 2 or 3
> times)

I reiterate that I've NEVER had problems switching back and forth between applications in GEOS.

> Online BBS systems would be up for 5 years at 24hrs-365days for Atari. 6
> months for C64
> Everything points to inferior parts and poorly designed OS.

BS! You have presented absolutely no tangible evidence for your argument.

Sorry if I seem like I'm coming across strong, but from previous
Commodore computer owners I've heard nothing but praise as to their
reliability and practicality. I have NEVER EVER heard first hand
accounts that sound anything like your message...EVER.

Geoff!

It should be noted, however, that the whole machine runs at approx 2 MHz
for NTSC, with the VIC and CPU sharing the bus for half the clock cycle.

Huh? If a game has x and y movement, it is two dimensional.

A vector used to describe the velocity of the "Pong" ball or "Combat"
bullet would need both x and y components.

You're turning simple math into something difficult.

Later,

Dan

April Auction

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, April 6 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

3138. The 9th Adventurers Convention

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-22 00:00:00 UTC
From: Larry Horsfield <Alaric@larryhorsfield.demon.co.uk>
Message-ID: <AmuhwgAwNLF1EwXn@larryhorsfield.demon.co.uk>
Source record: 64547

Hello all in C.S.A.8bit.

If you haven`t already heard about it, you may be interested to hear about the 1998 Adventurers Convention, which is being held in Birmingham (UK) this coming October, as it has been for the last 8 years.

The Convention is being held on Saturday, 24th October 1998, in the Ariel Suite of the Royal Angus Thistle Hotel, St. Chad`s, Birmingham B4, which at the end of the A38M and easy to get to from all parts of the country. It runs from 9am to around 6pm and covers all formats from Spectrums to PC`s, including Atari`s. Tables are available if you wish to bring along your own computer(s) and we actively encourage this as we depend on those attending to bring their computers, so the more the merrier! If you wish to bring hardware and/or software to sell you are more than welcome to, but no pirated software please!

The event attracts adventure enthusiasts from all over the UK, including Northern Ireland, and the atmosphere is very friendly and informal. Many of us stay overnight at the hotel and the evenings can be just as lively and interesting as the convention itself!

During the day we have the popular "Megapoints" competition running. In this the contestants get 20 minutes playing time at a specially written Spectrum text adventure, with the object of scoring as many points as possible in the alloted time. There are usually cash prizes and special certificates for the 3 highest scores. The adventure this year is being written by Ulsterman Jon Scott, author of various Spectrum text adventures published by Zenobi Software.

Tickets are available now and cost 6 ukp per person if you buy yours before 30th June, 1998. Thereafter, or if you pay on the door on the day, the price will be 7 ukp per person. Tickets may be purchased from:

Vicky Jackson, 128 Merton Hall Road, Wimbledon, London, SW19 3PZ

Please make cheques/PO`s payable to V. Jackson

* * * * * * * *

HOTEL ACCOMMODATION:

The Royal Angus Thistle Hotel has special room rates for those attending the Convention. These include full English breakfast and are as follows:

Single Room: 37.50 ukp per night.

Double/Twin: 32.50 per person, per night.

Please contact the hotel to book your accommodation, NOT the convention organisers. The address and phone number are:

Royal Angus Thistle Hotel, St.Chad`s, Queensway, Birmingham, B4 6HY

Telephone: 0121-236-4211

Don`t forget to inform the hotel you are attending the Adventurers Convention, otherwise you will be charged the normal room rates!

NOTE: The Convention is on the weekend before the start of the Birmingham Motor Show at the NEC. Whilst the hotel have promised to reserve a number of rooms for us, you are strongly advised to book your accommodation AS EARLY AS POSSIBLE to avoid disappointment.

If you have any queries about the Convention, or would like to reserve tables for your hard/software, please contact me at the email address below.

Hope to see you in Brum in October!

Larry Horsfield

This goes to prove your exposure to the Atari is non-existant! And you
reallyhaven't been on the computer scene very long

> even after being the VP of the local
> computer club!

I have been before, and currently am (again)thePresident of the Long
Island Atari User Group. I
got involved there in 1984..(and with the Atari in 1982!)

> My 64 worked fine from the day I opened it after bringing
> it home from the store to the day it got struck by lightning. (about 8

>

One isolated case proves only your were LUCKY. It has nothing to do
withoverall reliability. After many years of putting out crap, Commodore
nearing
the end of its production run started to put out a more reliable
product, but it
went from a nightmare to a managble crisis. The Atari worked fine 99% of
the
time. Took a lickin and kept on tickin.

You don't think. The Intel system is the most popular.

> People would have said, "Hey, this computer
> crashes a lot...let's buy something else." But they didn't, did they?

They did. They bought INTEL.

>

That was based on the misguided SIZE decision of the uninformed publicof
the time 48K vs 64K and that was the real modivation.

I got to try it out a local computer store. I got my first, second and
third crashin a matter of minutes. Productivity software relies heavily
on the operating
system. Each time I moved more than once between applications
the system fell like a deck of cards. Ever hear about the "reliability"
upgrade that commodore owners were putting into their machines (those
that did packet radio?) It was a modified ATARI operating system!
The commordore was a toy that ran games (but you had to take lunch
waiting for the loading.) The Atari was a true productivity tool.

>

I should have said inferior parts, poor assembly and poorly designed
OS.Atari users were subject to the decision makings of the designer of
the
C64 OS, Jack Tramiel. We are well aware of the difficulties of the
commodore
community, since ST users were having them too. (But less pronounced
since
the Tramiels did learn from their mistakes (namely the early
commodores))

Source record: 64552

One thing I used it for (in a slave kind of way) is to complement complex games on a second computer. Specifically what I did was to play the game Rocket Ranger on an Amiga (didn't mean to use such foul language here) and then write a BASIC program to easily pull up the rocket fuel codes. This way, I didn't have to use the wheel each time I wanted to change geographic locations, and it was harder to make a mistake, which would cost you in the game.

Another thing I've seen (but never used myself) was a home power control system called X-something. With it, you could use your 8-bit Atari to be a light and appliance controller.

Other than that, the 400 and 800 Ataris are the only systems I've seen where you can have four players playing one game. (the game has to support four players). Perhaps someone else can reply about games that use four players.

It would have to be a kind of TV Tuner, to receive the channel being sent
(on Atari computers, it would be 2,3,or 4 I think.) Then output the
signal.

3147. Upgrading a 600XL to 64k

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-22 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6f3jj8nlr1@newsd-199.bryant.webtv.net>
Source record: 64556

The best way to upgrade a 600XL is to plug the memory expansion card into the PBI bus in the back of the computer. There are a few sources for this, B&C Computervisions (www.myatari.com) sells one for about $19.95.

Q: What's the difference between Mechanical and Civil Engineers?
A: Mechanical Engineers design weapons, Civil Engineers design targets.

3148. $175 new 1050 worth it?

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-22 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6f3lbunmv1@newsd-199.bryant.webtv.net>
Source record: 64557

Looking at the B&C Computervisions web page (www.myatari.com), and I notice that they still sell the 1050 drive for $175.

Now, wasn't that the price 1050s were back in 1985? Now I can see that they paid a certain price for the drives, and of course there is a margin, but $175 still for a 1050? They ARE new, I suppose, not someones ancient drive that has been used for the last 15 years, or so...

By the way, they sell XF551s for $199.

On the other hand, they sell XMM804 printers for $75. Go figure.

Q: What's the difference between Mechanical and Civil Engineers?
A: Mechanical Engineers design weapons, Civil Engineers design targets.

If you can hunt and find a 1050 for $25 (and you can), you can afford to
purchase 7 for the price they want for one "new" 1050. Say one or two die
on you, you have plenty of spare parts. If you're asking for a
recommendation, I'd locate 2 used units... use them both or one for use and
one for backup.

If you are good with a soldering iron, you can pick up a couple of 64k x 4 bit chips to replace the current 16k x 4 bit ones. It's about a $5 modification and shouldn't take more than an hour.

I plan to do this myself to a 600xl, once I figure out why it is otherwise dead. There are several sites with the mod. Email me if you would like me to send you the text.

Pong is definitely 2 dimensional. It takes place on a plane with X and Y movement and zero depth. Frogger is however 3 dimensional. The frog has X and Y movement AND it jumps in the air to get past obstacles.

I tried to think of a good early 3 dimensional game and thought of Battlezone, but GeT tHiS: Battlezone is not 3D! It offers the optical illusion of being 3D but in fact it takes place on a plane, just like Tanks for Atari 2600. Night Driver is not 3D either.

I think maybe the first standup arcade video game ever was 3D, "3D Space?" by Nolan Bushnell. Outer Space for 2600 was also 3D.

Yes, Battlezone does have 3D elements. The smart missiles jump over
obstacles, and, if you get right up behind something, it can jump right over
you.

Most of the time they do share it, taking alternate half
1Mhz cycles - but from time to time (every line that sprites
are enabled on, and normally every 8th line of the screen
display) the VIC does take priority over the 6510, and makes
use of both halves of each cycle.

From: Eric Cron <ericcron@wwa.com>
Message-ID: <3516C4FF.644DA283@wwa.com>
Source record: 64136

Just starting to learn Atari BASIC.

I would like to detect any keypress. Up to now, I have been using INPUT A$, and telling the user to press return when I want to give the user a chance to see some output before moving on. I don't mind doing it that way, but I can't figure out how to get rid of the question mark that gets tacked onto my message. I have tried to print a "(ESC CONTROL Delete Backspace)" but that doesn't seem to work either. So, is there a memory location that I can test to see whether or not a key is being pressed? I have Mapping, but before I search, I thought I would ask the group. If so, what values will that location contain if a key(any key) is being pressed?

Thanks
Eric

Location 764 holds the value of the last keypress, so you can detect a
key without stop your program, something like this:

10 poke 764,255:rem first we clean the key reg.
20 ? "hola":rem this message will print until you press a key
30 if peek(764)<>255 then goto 50:rem if you press any key then you are finish
40 goto 20
50 end

if you need to know the value of the key pressed you can do it this way:

10 poke 764,255
20 ? peek(764);
30 ? " "
40 goto 20

If i made any mistake please let me know.
Hope it helps

Subject: 13.8) What games support 4 simultaneous players on the 400/800?

The following games support 4 player head-to-head play. Remember, only the 400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Breakout, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor.

Thanks to mailto:jlodoen@shell.portal.com (Jeff M Lodoen) for initial info.

(The Morbid Guy) wrote:

Question.

Recently I was back at my parents, went to play Blue Max, original disk
release. The XF551 made an awful noise, and I finally pulled out the
disk. The drive had eaten a clear streak right through the disk.

Thinking the XF551 was wrecked, I selected an unimportant disk to try
booting up, and it worked. Several other disks worked as well.

So I figured the Blue Max disk had gone bad.

Then, I realized I actually had two Blue Max disks around. So, I went and
tried loading the other disk.

The XF551 proceeded to eat this one as well.

My question is, did Blue Max always have an incompatibility with the
XF551, or does this particular XF551 have some incompatibility problem
with the copy protection scheme for Blue Max?

I know we used to always load Blue Max on the Indus GT, so I can't say for
sure whether it had ever previously loaded using the XF551. And I was out
of Blue Max disks to experiment with. :)

-Michael

There was a listing of all the 4 player Atari games. I think it was about
10 or so. Atari Super Breakout, Basketball, Dandy (nice Gauntlet-like
game from Antic), MULE, Asteroids (now that game is whole lot of fun with
4 players and some beer!!), and several others. Check the FAQ that
Michael Current posts every month.. I should say the URLs of FAQs..

Well, even if we might think those prices are high, there must be people buying them or else the company would have gone under long time ago.. (If I can get those kind of prices for my stuff I can make over $500 american dollars! wow!)

I think if you used INPUT #16, A (or something to that affect you could
avoid the ? prompt..), also I beleive POKE 764, XXX controlled keypresses.
So you could record keypresses, without seeing them.

Man, its been a long time since I dabbled in Atari basic. My memory may
be rusty! Sorry if I told wrong stuff! (Check location 764 in mapping..)

The Xf551 did die on some of the heavily protected disks. I had about 3
or 4 original disks that would die whenever you loaded them on the Xf551
(something to do with the RPMs. The copy-protection would record the RPM,
288 RPM for a 1050, and 300RPM for the Xf.. since they dont match up,
some protection schemes would make original software useless on the Xf551.
I have NEVER heard of the Xf551 killing disks.. (I guess it's the XF's
way of saying it doesnt approve of that copy-protection method! heh!)

So, you got me there.. the only thing I could think of is, test that game
on (a) a 1050 or (b) another XF551 and see what happens? My xf551 has
never been modified... it would die on some original disks, but it never
killed the disk! Has your XF been hacked?

PEEKing 764 returns the keyboard code of the key pressed, which is
different than the ATASCII code. Worse yet, there's no convenient
mathematical relationship between the two codes, so you can't easily
convert between them. GET and INPUT both return the ATASCII codes.

If you're going to use PEEK (764) to wait for a certain keypress, you have
to look up the keyboard code for it in a table before you can program it.

Message-ID: <01bd55eb$b2347620$64646464@gregm>
Source record: 64569

I figured about as much, but my program allows multiple Atari's (one per serial port) so all communications are interrupt driven; so a timed loop isn't the best choice.

After I posted, further tests showed it is possible that I am overrunning the Atari's UART on the getsector. Its a bit hard to tell because I may be missing interrupts, and I also appear to be suffering from invalid data segment values because of improper code optimization by the compiler (because of my command line options). When I get the timer code running, it will count 400us intervals, which is infrequent enough to not use up CPU time, but enough to get 1 ms or so fairly accurately.

I tell you, this is a WONDERFUL break from Windows programming!!!

Thanks,

Gregm

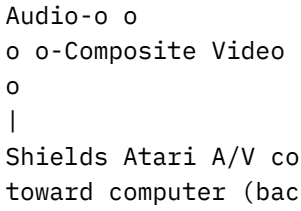
: (modulated video and audio) and seperate it into RCA style A/V jacks.

: Thanks in advanced.

Many newer TVs have composite video and audio inputs and these work pretty well with Atari 8-bit computers. The computers come with RF cables and boxes to hook to any TV. A/V cables are still available from vendors like Best Electronics, B&C ComputerVisions and others. Check the FAQ at

http://www.faqs.org/faqs/atari-8-bit/faq/

for phone numbers and addresses. It's also possible to make your own. Factory RF cables have a ferrite choke and are recomended but aren't absolutely neccessary. Most computer models have a female RCA connector for RF output but the 400 and 800 have permanently attached cables with RCA male plugs. The TV end will depend on whether you must use a 300 or 75 ohm connection. Cables, couplers, and adapters are probably available in your area at Radio Shack or where ever TV accessories are sold. For the A/V hookup, you could use a double RCA cable and 5-pin DIN connector such as Radio Shack 42-2352 and 274-003. Cut the connectors off one end of the cable, strip off the insulation and solder the wires to the DIN plug like this:



Steve

April Auction - Update 2

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, April 6 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

I believe Battlezone was marketed as the first ever 3D game.

M.U.L.E. supports four player!!
I don't know another 4player game ...
Other systems which supports 4player games: N64 (4 Joypad-Ports).
Uhm...any computer could support 4player games,
with joysticks, keyboard, mouse etc.
Any game-console could support 4player games,
with 4player-adapter ...

Make sure that your 2 1050 drives are NOT turned on, Im asuming there configured as DR1,DR2 If you do use your 1050 then configure ape to be DR:3 and on. If you still are having problems then double check you SIO lines to the SIO2PC.

Good Luck//

>
> Thanks
> Eric

Eric,
Using PEEK(764) as mentioned earlier is the best way. It's fast and
easy. Compute Books has a complete list of all of the keycodes for this
location in the "Third Book of Atari". It also has the Icodes (Internal
Codes used to plot the characters on screen, ATASCII codes and the bit
map infor for each character. This is a must have book for any Atari
programmer!
You can stack many different codes to build menus with one key-press
responses. I've done this in most of me BASIC programs. works great! The
best part is that it limits what keys CAN and CAN NOT be pressed for
responses. No erronious keys get proccessed!!!

Why don't you get the f**k into another newsgroup instead. I mean this is after all a newsgroup for the machines you say they shouldn't use. But, maybe they like (or even love) their machines. I do! I have a P200MMX, but it hasn't anything compared to the Atari's. There's souls in these machines, the PC's just keep crashing and are so unreliable. Long live Atari's and their users. Take Atarian care and have an Atarian day

Well, the Indus uses a Tandon mech, just like the one on the 1050, at least
the drives i have has Tandon on them, and as i stated in another post, i have

troubles formating disks in my xf and trying to read them in the 1050... In the other hand i have a couple of protected disks but never have trouble loading them in the xf, do you have the titles of the disks that didn't load on a xf????

Javier.

All depends on what you are programming, i've used 764 long time without trouble, i mean if i only want to know if a key was pressed or what key was pressed, i didn't care about the ATASCII value at all.... Also, Input and Get get you stocked until you press a key, so sometimes the use of 764 is more practical that anything... It's nice to know some people still cares about Atari Basic, Thanks TJ.

Greetings from Mexico.

Not a hacked XF551, just plain vanilla.

Anyone else tried booting Blue Max disks with an XF551?

Well, as you say. :) Yes, that's about right. Essentially it's got to be
if you want steady video I guess...otherwise you might end up with some
pretty funky looking video...plus the VIC takes care of memory refresh
too.

BTW, here's a table I located on the differences/features of the 65xx
family. This isn't a comprehensive list, but it does answer some
questions that were raised earlier...

> Device *Clocks Pins IRQ NMI RDY Port Address AEC Sync Speed (MHz)
> 6502 O 40 X X X - 64K - X 1,2,3,4
> 65CE02 O 40 X X X - 64K - X 0 - 10
> 6503 O 28 X X - - 4K - - 1,2,3,4
> 6504 O 28 X - - - 8K - - 1,2,3,4
> 6505 O 28 X - X - 4K - - 1,2,3,4
> 6506 O 28 X - - - 4K - - 1,2,3,4
> 6507 O 28 - - X - 8K - - 1,2,3,4
> 6508 E 40 X - - 8 64K X - 1,2,3
> 6509 E 40 X X X ** 1 M X X 1,2,3
> 6510 O,E 40 X X X 6,8 64K X - 1,2,3,4
>

So, it looks like the 6510 has an AEC (Address Enable Control) line.
Essentially stops the 6510 dead in it's tracks, and puts the address bus
in a high-impedence state. This allows for plug in processors like the
C-64 CP/M cartridge, the DMA feature in the ram expansion unit, and also
used by the VIC. It's used for other things as well, but those are the
main features. It also appears that the 6510 has a 6 or 8-bit IO port...
in the 64 this is used as control for the PLA and cassette ports.

BTW, in the current Jameco catalog, they list the 65C02 as a CMOS
version...but I seem to recall that the Atari Lynx used a 65C02 and it
used additional special instructions (in place of the undocumented 6502
instructions). May be two completely different chips.

In the original 400 (no weird bank swapping memory board that is) had
either 16k, 32k, or 48k starting at 0x0000. The BIOS was 10k decoded as
the top 10k.

I rescued an Atari 800 (16k) from a garbage can the other day where some ungrateful owner had deposited it after almost 20 years of service. (There's a BASIC cartridge in the left slot.) I'm not an 8-bit buff, but I'd hate to see this machine go to waste. If someone wants to pay for shipping from NYC, it's theirs for the having.

You should think about the people who don't have it as good as you.
All true Atari users are happy to own one of these fine systems, but
some users simply cannot afford to buy a PC clone because of other
obligations to family and the like. To expect others to meet you
standards
is callous, considering that the site is MEANT for Atari 8 bit
discussions.

Undocumented 6502 instructions?Every manufacturer documents the
instruction set of the microprocessor(s)
that they sell. Otherwise they would be very difficult to use, and
nearly impossible
to sell. The 65C02 is a CMOS version of the 6502 and will handle
additional
DOCUMENTED instructions, so it is an UPGRADED version of the 6502
and not two completely different chips...
It would be better to use the correct technical reference than to be
getting your
information out of parts catalogs...

Bj> with the correct com ports, but no luck. the atari has 2 1050's and
Bj> atari dos 2.5. also has dos xl. please help!!!!!!!!!

The problem is probably in your SIO2PC device.
Are you sure all connections are ok?
Is the soldering done right?
I had problems in the past because my soldering wasn't that perfect.
The connections have to be ok. If in doubt, you should try
to get a working device from someone else, and check if the
communication works fine then.
If so, you can exclude your IBM and Atari as being a source of error.
Then you know for sure that the problem is in your SIO2PC device (or
cable connections).

Good luck,
Bo.

If you'd paid attention to this thread you would have noticed that it's
been cross-posted in both comp.sys.atari.8bit and comp.sys.cbm since day
one. I think the idea was supposedly to have a non-biased discussion
(not argument over which is better) virtues of each machine. Since after
all the question was asked what the difference in SPEED and CPU's were,
I felt the previous post important to the discussion.

I have a few non-functioning 1050 disk drives lying around in the service department. Since it is no longer financially feasible for us to repair them any longer, anyone who is technologically capable of repairing them can have one for $10 or two for $15 (to cover the cost of packaging and shipping -- U.S. only) -- power supply and I.O. cable not included. If you also need a power supply and I.O. cable, you can have those for an additional $5 (for each unit).

Body handling: HTML body converted to readable text

You'll note that in the message you quoted, there are two MIME parts, one
text/plain (aka 'pure ascii'), and text/html. A halfway-decent newsreader
will recognize that it knows how text/plain works and not text/html, and
will show you the right one. Likewise, a decent HTML-based newsreader will
post just this sort of multi-part MIME message.

So, beyond the arguement over what sort of formatting markup you should
post with, even more important is to PROPERLY CONFIGURE YOUR NEWSREADER.

Since it seems to matter so much to you, I'd better set you straight.
First, I don't read this newsgroup in the basement, not that it matters
what room in the house I use. For the record, I'm in my living
room/office. I've never used a 400 (more's the pity - I'd like the
experience); I use a 320k 130XE.

Not all "pro writers" use HTML. I get paid for much of my writing; just
made a sale last week in fact to a trade journal for a profession that uses
computers, but isn't obsessed with them. That makes me a "pro," doesn't
it? I don't use HTML. I don't see much particularly compelling about the
'90s, either. They're almost over, anyway.

>Other than that, the 400 and 800 Ataris are the only systems I've seen
>where you can have four players playing one game. (the game has to support
>four players). Perhaps someone else can reply about games that use four
>players.

Now that reminds me - there's no reason why games couldn't be written now to take advantage of four players on the XL/XE. I have a joystick splitter cable somewher that uses the POT lines on the Atari joystick port to allow two joysticks to be hooked up to each port. It's a _very_ simple thing to do.

I have a huge collection of 8 bit hardware and software that I picked up. I've gotten what I wanted (an 800 to replace mine that died and an Indus disk drive). There are boxes and boxes of stuff left, including 4 800XL, a 400, a 410 recorder, trackballs, joysticks, a 1200 baud modem, etc. There is also tons of software and many many magazines. Some of the software is original, and some is "copied". If anyone has something in particular that you've been looking for I'll check to see if I have it. All reasonable offers will be considered.

I currently have one of the 800xl's, a 1050 drive, a trackball and 2 games on "Ebay" for auction. Starting bid is 25.00.

E-mail me at jfulker985@aol.com if you have anything youwant me to look for.

Thanks,

Jerry

Digikey has them from $6 to $9 each in a variety of packages and suffixes.
The 232's are cheaper, Harris and Maxim both produce them, probably others
do too- and are also available thru Digikey and likely JDR/Jameco also.
The only thing is the 233 doesn't require extra components, whereas the 232
does (only 4 small capacitors). Analog makes some no external component
rs232 drivers, but I don't know a mailorder source.

SpannerWerksï¿½ ï¿½Jeez, I still have that?!?ï¿½ Auction

Just a little auction to clear out the Atari ST & 8 bit debris in my
room.

AUCTION RULES:

1. Standard rules apply. Please mark all bids with the subject line
"Auction" so I can quickly separate them from other emailsï¿½messages so
marked will get first priority!

2. Items will start a Going, Goingx2, Gone phase Friday, April 12th.
At this time, items' status will change after every two-day period
without
a raised bid. If an item fails to attract the assigned minimum bid by
Sunday April 5th, it will be pulled from the auction.

3. Minimum raises in bids are in $1 increments.

4. Updates will be posted every other day to both the newsgroup and the

participants. Please let me know if you wish to be taken off the
mailing list for the auction. I will only confirm bids by email for the
highest
bidder on each item.

5. Only the highest bid will be listed. On tie bids, the first one
received will be registered as the high bid for that item.

6. No lot bids except for the items already listed as lots.

7. Payment must be made by money order or personal check. If you're
bidding on more than one item you may pay for all your items at once.
However, if after two weeks following confirmation of final total I have

not yet received your payment, the items are forfeit and the next
highest bidder will be contacted.

8. Shipping will be by USPS or UPS, whichever is cheaper for you if you
have no preference. Prices do not include shipping.

9. Detail on condition of item available upon request. Let me know if
you have any further questionsï¿½thanks!

The items:

ITEM Min Bid Curr Bid/Bidder

520STm (1 Mb) $10
w/ PS, Mouse &
Astra EasieST
Solderless RAM
Expander (up to 4mb,
512k installed)

SM124 monitor $10
(curving lower
left corner)

SF 354 FDD $5
w/ Cable &PS

SF 354 FDD $5
w/ Cable &PS

IB Drive 5.25ï¿½ FDD $10
w/ integral cable, Manual &PS

Megafile 30 w/ DMA $20
Cable
+ 2 Spare MFM HDDs

Spectre GCR w/ 128k $30
ROMs, v3.0 software,
MAC software, manuals

StereoTek glasses $30
w/ cartridge, manuals,
packaging

CX22 Trackball $2

CX22 Trackball $2

Samsung 2400 bps $3
modem w/ PS

Atari Mega $5
Field Service Manual

Atari 520ST $5
Field Service Manual

Atari 1040ST $5
Field Service Manual

Atari STe $5
Developer Addendum

Atari CDAR504 $5
Developer Reference Manual

WICO Joystick $1
Command Control

Prostick Joystick $1

800XL w/ PS, $5
manuals, packaging,
RF Converter, all in the
original box & plastic wrap
(POWERS UP, BUT NO PICTURE)

Xetec GraphixAT $5
SIO to Parallel converter

Sound & Graphics $1
(Book for 400/800)

Leader Board $1
(Golf Game w/ Box, disk,
manual, dongle)

DOS3 Reference $1
Manual

DOS II Reference $1
Manual

Synfile $1
(Database for 400/800,
w/ manual, disk, binder)

Atari BASIC $1

Master Memory Map $1
(400/800)

Atari 1020 Color $2
Printer/Plotter w/ paper,
PS, manual, 4 dried up pens

Centipede Cartridge $1
CXL4020

Fun With Art Cartridge $1
Epyx

I can afford and use a PC and STILL don't want to see HTML in news or
mail. It does not belong there.

Your missing the point - Newsnet doesn't not use anything other than plain unadulterated ascii. There are standards at work here that you should adhere to. Just because you have a newsreader that can handle html or mime, it doesn't mean you have to use it.

The Internet got to be what it is over the last 20 odd years by sticking to standards. If everyone starts fragmenting with a mix of incompatible message types then the usefulness of what they say will be lost to many people. People access the Internet/Usenet with Unix, PCs, Macs, mainframes, Ataris, Amigas, Apple IIs etc. and you should never lose sight of that. Not every platform has access to every new technology that comes along and in the case of Usenet, why should they?

3228. Hasbro/Atari News Article.

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-25 00:00:00 UTC
From: ansawdd@aol.com
Message-ID: <1998032511563901.GAA06517@ladder03.news.aol.com>
Source record: 64238

The following article appeared in this week's PC Dealer - a PC Trade magazine in the UK ...

HASBRO SELLS ON SENTIMENT

Hasbro is set to start a retro gaming trend following its acquisition of the rights for 75 Atari games from hard disk drive developer JTS for $5 million.

The children's manufacturer has experienced success in the games market with family titles such as Monopoly and Trivial Pursuit. The first game to be released from the portfolio of retro titles will be Centipede. Other classics destined to reappear on the high street will include Missile Command, Breakout, Pong and Asteroids.

Mary Miller, UK marketing director for Hasbro, revealed that the games would appear in both PC and Playstation format. "The main reason was that we launched Frogger in November last year, and it has now sold nearly one million. We realised that this retro thing could be big, so we went for it," said Miller.

However, Ian Hawkins, customer services manager at Electronic Arts, felt the classics may not stand the test of time: "I remember playing a text-based adventure game on the ZX81, which was great at the time, but it could wither in the shadow of new games. People may buy it and play it once for nostalgia. Good luck to it though, it has seen a niche in the market," he said.

Hasbro also acquired the rights for Atari hardware, but stated that it had no plans at present to develop an Atari console.

** Note the fact that Hasbro have bought the rights to 75 games and the Atari hardware ... but what about the Atari name itself? **

April Auction - Update 3

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, April 6 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

AFTER system ram
the OS Rom is from $D000-$FFFF
$C000-$CFFF was unaddressed space
System Ram ended at $BFFF
Also a lot of low mem was used for stuff

Did the HTML Mapping the Atari ever get finished?

Hey, I have a clone, and I _STILL_ feel that HTML does little or nothing
for communication. But then again, advertising doesn't sway me either :)

Yes, but those are only good writers. Pro writers use HTML effectively.

Stop reading this newsgroup in your basement with that old 16K 400.

Buy a PC clone and live in the 90's already!

>the heads.

Jeez. You guys (and there seem to be dozens, if not hundreds of you, if I count other forums than just this list) who go out and find "mass quantities" of stuff such as 1050-drives-for-$5.00-each, at "Thrift shops," are really starting to MAKE ME SICK with JEALOUSY!

What the HELL _IS_ a "Thrift shop" in the sense you speak of? The only thing I've seen in the Rochester, NY, area that even BEGINS to fit the description, are the Salvation Army and Volunteers of America stores -- whose stock consists about 99.9% of smelly old clothes, dusty/chipped old dishware, and pieces of old plastic toys. Throw in a few moldy paperback books and a cardboard box full of almost-moldy vinyl LPs (anybody here old enough to own "records"?), and you've pretty much got every "Thrift shop"-like store within three hundred miles, AFAIK. They've NEVER had a SINGLE piece of computer, videogame, or other electronic hardware, in all the years I've been snooping in vain for such. Okay, maybe an occasional Colecovision game cart, but -- jeez.

So. What are the NAMES of the "Thrift shops" YOU are speaking of? What IS a "Thrift shop," precisely? Am I even on the RIGHT TRACK, thinking "Thrift shop" means "Salvation Army/VOA?" If so, why is it that these stores in OTHER parts of the country seem to have a continuous flow of classic computer-and-electronic equipment, while the stores HERE are lucky to have maybe a single Colecovision game cartridge once in a blue moon?

Inquiring/desperate minds want to know!

It looks like this article was mostly derived from the Wall Street Journal
article, which got several things wrong, including what you ask about.

Hasbro bought EVERYTHING. All Atari intellectual property: the
copyrights, trademarks, and patents, for all Atari-branded products for
the home market ever released.

Other flakey info from the Wall Street Journal article:

WSJ: games bought by Hasbro include Pole Position and Defender.

me: Pole Position was developed by Namco; Defender by Williams. But Atari
may still own exclusive rights to produce home versions.

WSJ: Atari had sold the rights to their classic games to JTS

me: Atari and JTS merged!

WSJ: JTS obtained the Atari properties in the early 1990's

me: the date was 7/31/96. you call that the early 1990's?

WSJ: the dollar figure for the Hasbro acquisition of Atari was undisclosed

me: according to the SEC filing by JTS, which is a public document, the
amount was $5 million.

This part from the UK' PC Dealer article was interesting:

>Hasbro also acquired the rights for Atari hardware, but stated that it had no
>plans at present to develop an Atari console.

I hadn't seen Hasbro mention plans, one way or the other, of doing
anything but rereleasing some old classic Atari game titles.

If it has, I havent seen it. Thanks for your map, Whistler's brother.
But where would the OS ROM begin in the 8k/16k 400? Would it still start
at $D000?, leaving a huge gap of unaddressed space?

WSJ are probably right here, certainly in the case of Defender. I still remember full page adverts being placed by Atari in Personal Computer World around '83 that promised dire consequences if anyone produced as much as a clone of any of their software. They had an ad for each of the main games they were concerned about ... Defender was one of them.

>WSJ: Atari had sold the rights to their classic games to JTS

I wasn't the original poster but I'll chip in with an answer:
Yes, I think you've got it right. The description you gave
sounded just like all the Goodwill stores I've ever seen!

-> What are the NAMES of the "Thrift shops" YOU are speaking of?

A quick check of the phone book here in Censornati, for example,
shows that VOA has an office in a "poor" neighborhood but it's not
listed as a thrift store. The Salvation Army has three thrift
stores but the biggest and most well-known operation is that of
Goodwill, who have ten thrift stores in this area. Goodwill Indus-
tries employs handicapped people who repair and refurbish donated
items, and I believe they're located all over the country. There
may also be other charitable organizations operating second-hand
type stores, but these are the most famous.

-> [Why] is it that these stores in OTHER parts of the country seem
-> to have a continuous flow of classic computer-and-electronic
-> equipment, while the stores HERE are lucky to have maybe a single
-> Colecovision game cartridge once in a blue moon?

For one thing, bigger cities will likely have more thrift stores
than smaller cities. And stuff like old 8-bit systems will also be
more plentiful at the thrift stores, hamfests, and flea market sec-
tions of computer shows in bigger cities. The Goodwill stores in
Censornati have always had large sections of small home appliances,
including old computer junk. (Pardon me: Make that "junque.")

Over the years, especially in the '90s, we've had plenty of
stories about great finds at these stores. About four years ago
one guy crowed on a local Atari BBS about finding an 8-bit system
of carload size for $15 at one of the Goodwill stores. But prices
are variable; sometimes their asking price for old computer stuff
is higher than the current market level and the stuff sits on
their shelves for a long time.

Perhaps the most important reason old computer stuff would be
absent from such stores is POLICY. I saw a wire service article a
couple of years ago reporting that thrift stores around the country
were generally refusing to accept old computers and were simply
pitching any they got into the dumpster because they're inundated

with this stuff, nobody wants to buy it, and so they consider it
worthless.

> >chips.

Yes, the 65C02 is an upgraded 6502 with additional and fairly useful instructions. A subset of these instructions are upwardly compatible with the 65816. There was a version called the 65SC02 that only supported that subset. It was also used in later Apple IIe's and all (iirc) IIc's. Some later Apple II software depends on it.

It is not to be confused with the 6502C used in later Atari 800s and all XLs and XEs, which is a 2 Mhz 6502 with some timing logic built in.

> Undocumented 6502 instructions?Every manufacturer documents the
> instruction set of the microprocessor(s) that they sell. Otherwise
> they would be very difficult to use, and nearly impossible to sell.

Blah, blah, blah. The truth is, illegal (undefined) op codes on most-if-not-all versions of the 6502 do (mostly weird) things, and some of them were used by too-clever programmers to shave cycles for games and demos. They are (iirc) different on different versions of the 6502, and iirc there are some differences within the product cycles of individual versions like the 6510, so using them is really not the best idea if you want other people to use your code. Nonetheless, a number of games and demos rely on them, and good C64 and Atari emulators support them.

Naturally, upgrading your system with a 65C02 will break code that uses these "undocumented" instructions. Also, I think any undefined op codes left on the 65C02 are equivalent to BRK.

It was kind of amusing to sit down with a debugger and try to figure out what the undefined op codes do, though.

>unadulterated ascii.

Actually, I get the point very clearly. Some people feel that HTML is just
fine for posting to usenet, because it allows them some other ways to
express themselves (whatever that means), and other people feel that HTML
should *not* be on usenet because it is difficult for some users to read,
given that they don't have HTML-capable newsreaders.

How am I doing so far?

>There are standards at work here that you should
>adhere to. Just because you have a newsreader that can handle html or
>mime, it doesn't mean you have to use it.

Ok, so what you're saying here is: Even if *you personally* had a
newsreader that could handle both MIME and HTML, you probably wouldn't use
it because you don't like HTML?

>The Internet got to be what it is over the last 20 odd years by sticking
>to standards. If everyone starts fragmenting with a mix of incompatible
>message types then the usefulness of what they say will be lost to many
>people. People access the Internet/Usenet with Unix, PCs, Macs,
>mainframes, Ataris, Amigas, Apple IIs etc. and you should never lose sight
>of that. Not every platform has access to every new technology that comes
>along and in the case of Usenet, why should they?

'Every new technology?' Like MIME encoding!?

MIME exists *because* there are a zillion different platforms being used to
do internet stuff. MIME is *exactly the solution* to the problem being
discussed here! THAT'S WHY IT WAS DEVELOPED!

A decent newsreader (a subset to which the Netscape one apparently doesn't
belong) knows about MIME. AND.. web-based newsreaders should be polite
enough to include both a text/plain and text/html version of the item

posted. AND.. if it does that, then you can still read the message even if your newsreader doesn't 'do' MIME, because there will be a text/plain version.

And likewise, you should remember that some people access the net thru WebTV and other sources that might very well only know how to talk HTML. You should never lose sight of that fact. :-)

Shopping at thrift stores (or 'thrifting') is great fun and hours of amusement.

I found a 1050 drive at Value Village yesterday for $2... Haven't tested it
out yet.

You have a good understanding of what a thrift store is. Old clothes, moldy books and scratched-up records, and all kinds of assorted cultural detritus. Finding what you are looking for at a thrift store is something akin to finding the holy grail; it usually doesn't happen. But its important to remember that the merchandise at these places is in a constant state of flux... You have to keep going back again and again and in the mean time pray real hard that something good will be there.

Look in the yellow pages under thrift stores. Devote a Saturday afternoon to going all over town to every store.. Urban areas are better for thrifting than rural ones.

Pawn shops sometimes have old computer stuff, but the prices are usually ridiculously high, since know one knows what its worth. I've never tried to haggle at a pawn shop...

have fun!

I REALLY hate to add to this discussion, but fully half the posts here whineing about a html post?? surley you must have SOMETHING better to do!! How long has html been around?? How long has MIME been around?? C'Mon guys.. just get with the program...

after all, it's ONLY been about 18 YEARS since the old atari's were produced... should we not have cassette tapes available?? should we still be using 8-tracks?? Yeah they DO have thier place, but agan, this is the information superhighway, not some old podunk dirt road.. and I DON'T make a ton of cash, and Yeah I do have bills.. but a even halfway decent pc used for internet access is VERY cheap nowadays...

Please don't even try to argue with me.. I'm out of the discussion now.... and if I find something that I feel needs to be posted in html, I will.. otherwise, I'll use text.. whichever I feel like at the time..

Now back to the old atari.. I heard someone tell me that the keys worked right on rescue at fractalus on xl-it... has anyone else had this luck??

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

SpannerWerksï¿½ ï¿½Jeez, I still have that?!?ï¿½ Auction

Just a little auction to clear out the Atari ST & 8 bit debris in my
room.

AUCTION RULES:

1. Standard rules apply. Please mark all bids with the subject line
"Auction" so I can quickly separate them from other emailsï¿½messages so
marked will get first priority!

2. Items will start a Going, Goingx2, Gone phase Friday, April 12th.
At this time, items' status will change after every two-day period
without
a raised bid. If an item fails to attract the assigned minimum bid by
Sunday April 5th, it will be pulled from the auction.

3. Minimum raises in bids are in $1 increments.

4. Updates will be posted every other day to both the newsgroup and the

participants. Please let me know if you wish to be taken off the
mailing list for the auction. I will only confirm bids by email for the
highest
bidder on each item.

5. Only the highest bid will be listed. On tie bids, the first one
received will be registered as the high bid for that item.

6. No lot bids except for the items already listed as lots.

7. Payment must be made by money order or personal check. If you're
bidding on more than one item you may pay for all your items at once.
However, if after two weeks following confirmation of final total I have

not yet received your payment, the items are forfeit and the next
highest bidder will be contacted.

8. Shipping will be by USPS or UPS, whichever is cheaper for you if you
have no preference. Prices do not include shipping. Prices are un US
dollars. International bids OK.

9. Detail on condition of item available upon request. Let me know if
you have any further questionsï¿½thanks!

The items:

ITEM Min Bid Curr Bid/Bidder

520STm (1 Mb) $10
w/ PS, Mouse &
Astra EasieST
Solderless RAM
Expander (up to 4mb,
512k installed)

Brent> Naturally, upgrading your system with a 65C02 will break code
Brent> that uses these "undocumented" instructions. Also, I think any
Brent> undefined op codes left on the 65C02 are equivalent to BRK.

It will also break code that relies on other undocumented features,
such that read-modify-write instructions write two times (first the
unmodified value, then the modified one), or that the processor cannot
be stopped with RDY=low during write cycles. The Rockwell R65C02 data
sheet thinks that undefined op codes are equivalent to NOP.

3253. Hasbro Classic Conversions

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-26 00:00:00 UTC
From: ansawdd@aol.com
Message-ID: <1998032600224801.TAA14431@ladder03.news.aol.com>
Source record: 64263

My mind was drifting somewhat earlier on today to days gone by. Missile Command, Pac Man and all those other delights ... and then came the dark spectre of Hasbro.

Well, what I was actually thinking about was "what on earth are Hasbro going to do with all those classics?"

I haven't seen Frogger on the PSX but I hope they plan on Minterising (new word to add to the English dictionary) the new games they've got their hands on. What about Pac-Man 2000? Another three games in one package ... Pac Man, er, Mrs Pac-Man and Pac-Man 2000.

Pac-Man 2000 could be truly daft. How about powerups instead of power pills, or super power-ups instead of cherries and strawberries. The super power-ups could be collected by either Pac-Man or one of the Ghosts and they would be transformed into something out of a TV show or movie. How about Pac-Man or a Ghost turning into a Shadow Vessel from Babylon 5 ... complete with a rendition of the theme tune while the transformation is in place ... and with the ability to fire a particle weapon that'll take out walls in the maze, or zap the other sprites.

Just because an idea is old, it doesn't mean that it can't be hip and up-to-date.

3254. New Atari Emulator - Need Info

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-26 00:00:00 UTC
From: ansawdd@aol.com
Message-ID: <1998032600304100.TAA15887@ladder03.news.aol.com>
Source record: 64264

I'm looking at the possibility of writing my own Atari 8-bit emulator for Windows but was wondering if there are any docs I can download on emulator programming.

I can't see any serious problems apart from Pokey emulation which seems to be giving most other emulator developers problems.

IIRC, the undocumented opcodes were NMOS artifacts, and generally act like combinations of instructions (so it looks like two logic paths are getting activated by them).

What would be cool is something like that really is a primitive form of multiprocessing if you think about it, but I guess only a good cycle count could say for sure.

Not accurately. You missed an additional reason why some feel HTML
should not be used on usenet or mail. That reason being because it is
against standard.

>>There are standards at work here that you should
>>adhere to. Just because you have a newsreader that can handle html or
>>mime, it doesn't mean you have to use it.
>
>Ok, so what you're saying here is: Even if *you personally* had a

>it because you don't like HTML?

Lack of accracy again. There is a distiction between not liking to
use HTML in news or mail and actually not liking HTML. You are
misrepresenting your 'opposition's' argument and then shooting it
down. This is called the staw man tactic.

>>The Internet got to be what it is over the last 20 odd years by sticking

>
>'Every new technology?' Like MIME encoding!?

New as in not incorporated into the standards specification yet.

>MIME exists *because* there are a zillion different platforms being used to
>do internet stuff. MIME is *exactly the solution* to the problem being
>discussed here! THAT'S WHY IT WAS DEVELOPED!

News allows use of UUENCODING which was also developed for the same
purposes and is supported in the standard. MIME may also be included
but I am unsure of that at this time. Anyway, even so news mandates
that such UUENCODING (or MIME also if it is in fact in the standard)
be done in special BINARY type newsgroups. People with no ability, or
who wish to avoid handling messages with encoding know to stay away
from binaries groups.

>A decent newsreader (a subset to which the Netscape one apparently doesn't
>belong)

Decent in who's opinion? Yours? The standard dictates what is
allowed and what is not. You sir, do not dictate what is allowed
based upon what you believe to be 'decent.' I think HTML is cool, but
I don't want it cluttering up news until it is officially accepted.
Is that so DAMN HARD a concept for you to deal with?

> knows about MIME. AND.. web-based newsreaders should be polite
>enough to include both a text/plain and text/html version of the item

Hmm. 'Should be...' Again, in who's opinion? Yours no doubt. I may
even share that desire (or may not, it isn't relevant anyway) but the
standard is what's relevant. Not your personal preference, or the
preference of Nutscrape or Mickysoft.

>posted. AND.. if it does that, then you can still read the message even if
>your newsreader doesn't 'do' MIME, because there will be a text/plain
>version.

>And likewise, you should remember that some people access the net thru

>You should never lose sight of that fact. :-)

First of all, if WEB-TV isn't compliant with a defined and known
standard, then that's just tough shit for WEB-TV and it's users. In
any event, HTML capable software CAN deal with plain text.

You shouldn't loose sight of those facts.

3258. Re: Waiting for keypress

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-26 00:00:00 UTC
From: Carl & Delinda Tenney <delitene@netins.net>
Message-ID: <01bd5894$ed670e00$670f8ea7@login.netins.net>
Source record: 64268

Encouraging to see all the replies. Here is my two cents...

I also used Peek(764) to register whether or not a key was pressed. Remember though, that when you press most keys, the 764 location contains a value associated with that key, but also that the key is still in the buffer, i.e. if you read 764, you can still open #1,4,0,"k:" and get #1,a. This way, you can know whether a key was pressed during a routine without waiting for one, but if you catch a key, you can still get it with the normal value. An example:

```
10 Rem This is freeware, starting now :)
20 Print "Press a key before it is too late, or while I calculate
something..."
30 For a=1 to 10000
40 p=peek(764)
50 if p<255 then pop: goto 70:REM the pop kills off the "next a" (in line
60) from the stack so we don't have to use it
60 next a:goto 80
70 open #1,4,0,"k:":get #1,b:close #1:goto 90
80 print "Ooops, you are too late":goto 100
90 print "The key you pressed is ";chr$(b);"."
100 end
```

And of course, you are screwed if you press Shift or something (since it would then sit at the get statement in line 70 waiting for a *real* key to be pressed.) But in my heyday, I would have had the *umf* to make a few if/then statements to trap out any unwanted lackadaisy keys such as ctrl, shift, etc.
Carl
PS can anyone tell me if I blew syntax above? Thanks

No, I'm saying I wouldn't use it because I *shouldn't* use it on Usenet.

> MIME exists *because* there are a zillion different platforms being used
> to do internet stuff. MIME is *exactly the solution* to the problem
> being discussed here! THAT'S WHY IT WAS DEVELOPED!
MIME is all well and good if your ISP supports it. It's a function of both
the reader software and the mail gateway you go through. Many have it but
not all and The Internet has always been based on a lowest common
denominator model.

> A decent newsreader (a subset to which the Netscape one apparently doesn
> 't belong) knows about MIME. AND.. web-based newsreaders should be
> polite enough to include both a text/plain and text/html version of the
> item posted. AND.. if it does that, then you can still read the message

All well and good but all that extra stuff takes time to download and
costs money. In the US you have free/almost free local calls. Not
elsewhere. In fact in the UK, it is illegal for British Telecom to offer
free local calls - it was a stipulation of privatising the industry an
number of years back. The result is that if I access a lot of Usenet
postings with HTML, I'm spending maybe 3 times as long on the phone at 3
times the cost. Fair? Hardly. And no, saying "sort your dumb country out"
isn't the answer either. Most of the rest of the world doesn't have the US
model for local calls. Wish we did though ;-)

> And likewise, you should remember that some people access the net thru
> WebTV and other sources that might very well only know how to talk HTML.
> You should never lose sight of that fact. :-)
Fair enough but then I'd argue that the WebTV software should post raw
ascii. It's the software's fault, not the user.

> d for internet access is VERY cheap nowadays...
In the US, maybe. It's very easy to think the rest of the world is an extension of your own experiences. It isn't. The Internet is global and should not be treated as US only. PCs are a lot cheaper in the UK than they were but they're still not cheap. Compaqs are about twice the price here and the average high street shop (where most non-IT literates will go to buy anything) will make you pay £1200 for a P166 or AMD K6 with 2Gb HD and 32Mb of RAM. Thats about $2000 for what you'd pay, what, $600? Other countries and emerging markets will pay even more for stuff. Office 97? That's about $550 equiv. in the UK. AOL access? $30 a month plus about $1.30 an hour phone charge.

Just a quick note...

I access this newsgroup through America Online and it does NOT support HTML or MIME messages. Just because you have the latest Pentium model and the newest Netscape/Explorer version does not mean that you will access this newsgroup and see the artistic endevours of its posters.

And ASCII is the standard and the RULE in newsgroups and I for one wish people would just post their messages without all the fancy artwork.

Just my two cents.

Al

Ken,
I have an original ATARI disk of the original in store demo. I'll see
if I can DCM it and e-mail it to you. It has an odd format to it so I
hope I can DCM it. Give me a few days (maybe Monday or Tuesday). I'll
let you know either way!

>$50 for a game 10-15 years old is insane.

Not trying to start an argument, but when does age dictate price or value?

I see this same line of thinking used when someone puts a price on a "dead" video game system like the Jaguar: "Why should I pay $59 for Zero 5 when the Jaguar is a DEAD system?"

To me, price and value should be determined on whether YOU LIKE the product, not whether it was written 10 years ago or the system it was intended for is no longer supported by the manufacturer.

If the enjoyment is there and you LIKE the title, then its worth the money you spend for it, no matter when it was written or made.

I don't believe age has anything to do with it; I can name many programs that were written 10 to 15 years ago that are worth more in value (at least to me) than some of the stuff being written today.

(getting off soapbox)

Sorry... don't know what came over me.

Back to your regularly scheduled messges.

Al

But then again, Zero 5 is not such an old game, and it's still available. I
just mean I wouldn't pay $50 for Pole Position, even if I love the game. I
got 2 shrinkwrapped ones and 1 I use. I paid about $5 each or so. That's
fair and even if Atari charged $50 or whatever (I live in Norway, so I
don't know) 15 years ago, that game has been sold for many years for less.
That's what I meant by I'll pay $50 for Starfleet I, because I love the
game and I think it's worth it. I don't think Pac-Man is worth $50, if you
see what I mean. I love Pac-Man too and got it on my shelf for $2 or
something

Yes, still would. All the vectors to standard system routines are in
the $E000 area, so if it weren't so, all software would have to be
custom compiled with different equates for different memory sizes.

I don't think you need to worry about the 8k 400, it's a safe bet no
one is really using them. I think atari upped it to 16k soon after
production started anyway.

As always, there will be people who don't pirate and are adamant
against it, people who don't pirate but live and let live, and people
who ONLY pirate. I doubt that the companies involved are still caring
about it, since the stuff has been spread far and wide, but it IS
still theft in intellectual property. However, I did it in the 80's
and still do it (for 8 bit atari) and no one has ever bothered me now
nor then.

Wasn't the SPA started by Broderbund?

How many of those companyes still exist??? Just Curious.

There are a page of Games and Demos, by Sven Gleich, he has made a fantastic
recovering of dozens of demos made for the Atari, i think the demo you are
asking for is in one of those disks, you can find it's URL in the Atari 8-bit
Resort, At this time i've download about 7 Megaimages of just Demos... And a
modified version of the Asskiker, the best demo i've seen in the 8-bit Atari.

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

Cross-posted to: rec.games.video.classic,comp.sys.atari.8bit,comp.sys.ti

I am trying to compile a list of all the original (or licensed) games Romox offered for various systems via their Romox Programming Terminal. This unit would burn games into an ECPC (Edge Connector Programmable Cartridge).

I know they offered games for the 2600, Atari 8-bits and TI computer. They possibly also supported the C64 and/or Vic-20.

If you have an ECPC cart in your collection and I don't list it below, please e-mail me the title. If anyone has a catalog or related documentation, please contact me!

Atari 2600

Schnoz-Ola
Topper

Atari 8-bits

Castle's and Keys
Porky's
Topper

TI 99/4A

Schnoz-Ola
Topper

Romox produced several regular titles for the Atari 8-bit, all of which may have possibly been offered at the terminal. They are Ant Eater, Attack at EP-CYG-4, Flapper, Fortune Hunter, Princess and the Frog, Seas Chase, Spark Bugs, Starion, Typo, Whiz Kid.

Romox produced these titles for the TI 99/4A: Anteater, Hen Pecked, Princess and the Frog, Typo, Typo II.

Why do these laws *really* exist? Well, when you have a Federated shelf full of $50 Print Shop's and you duplicate it for free for everyone you know, nobody is buying it and Broderbund is losing customers and money. What money is Broderbund or Epyx or Electronic Arts losing today if we copy their software? Nada! Because these games are not retailed anymore! With the possible exception of Timewise, that occasionally shows up in these 99cent stores for a buck, these products are no longer in competition with the software pirates. Do you think someone is going to file a lawsuit and spend the $$$ to defend a 15 year old product that is worth virtually nothing to them?

The thing we have to be considerate of is the new software coming out, like the emulators, BobTerm, etc. These guys are working on this stuff to try to improve everyone's 8-bit experience and deserve enough respect for that to not copy their stuff.

Caldera did the right thing with CP/M. It's freely available to the public, with a non-commercial license agreement. All this great old software is now available, again, after almost 20 years! Bravo. I case anyone from the original Atari software powerhouses, TAKE A HINT!

My $1.50 worth.

3279. WTT: HUGE Atari XE Game setup for...

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-26 00:00:00 UTC
From: Frank Traut <save2600@ticon.net>
Message-ID: <351A91D5.5A34@ticon.net>
Source record: 64339
Cross-posted to: rec.games.video.marketplace,rec.games.video.classic,comp.sys.atari.8bit

a Neo-Geo cart system + some games.

The XE game system is like new in the box and includes
the deck, keyboard and joystick - sorry, no lightgun
or instruction book. Also included is an XF551 disk
drive whic happens to have its book :-)

I have over 100 different game carts for the Atari
800/XE computers plus over 60 different *original*
game disks. Most of the carts and disks include their
original boxes and manuals, some are still shrinked!
Everything is in real nice cosmetic condition and works!

I am looking for a Neo-Geo cart system w/ 2 joysticks,
memory card and some games. Here are some of the games
I would be most interested in:

Baseball Stars II
Burning Fight
Ghost Pilots
King of Monsters II
Last Resort
League Bowling
Magician Lord
Metal Slug
Riding Hero
Sengoku
Sprintmaster
Stakes Hero
Thrash Rally
Top Players Golf

**Please note: These are the games I would like to get
someday. Not what I expect for my 8-bit stuff ;-)

I ask that if you want to do a trade with me, that
your stuff be in the same condition as my stuff.
For those who don't know me, that means - most of
my stuff is in mint shape and is usually complete.

For the particulars of what I am offering, please see
my web page: http://www.ticon.net/~save2600
I have listed alphabetically all of the carts that
I am trading. Just point your mouse to: My Atari 8-Bit
Collection...

Thanks for reading!

-Frank

3280. Re: HTML and this Newsgroup

Gary,

This is an enthusiasts group, you question as to why is stupid.
Why do people collect stamps, why dig up dinosuar bones, why rebuild a
50's car, why have an Apollo 11 exhibit in the Smithsonian. Its all
about wanting to delve into and enjoy something that people like.
This message group is not titled "Bleeding Edge Technology" therefor
this group is not looking for that.

This is about enjoy, working with and improving upon machines that
were way ahead of their time when they came out and about hacking them
and pushing way past the envelope. If your having a difficult time
understanding that then I'm sorry you live in a 2 dimension realm of
though.

By the way, since you want everyone to abandon their appreciation for
older technology then you'd better run over to the CP/M and S-100 bus
groups from the mid-70's and straighten them out too!!! Sheeeezzzz

> Thanks, Austin, I Have read that the first 400's had -only 8k- of ram.
> Should i concern myself with these models or are they exceedingly rare?

Also, be aware the cartridge (8k or 16k) would preclude the RAM.

I don't know your application, so I can't tell if the 8k systems might give
you problems or not...

Here is the 'official' memory map from their original docs:

0000-1FFF = RAM (minimum required for operation)
2000-7FFF = RAM expansion area
8000-9FFF = Cartridge B, Cartridge A (half of 16k size) or RAM
A000-BFFF = Cartridge A or RAM
C000-CFFF = Unused
D000-D7FF = Hardware I/O decodes
D800-DFFF = Floating Point Package (OS)
E000-FFFF = Resident Operating System ROM

Obviously, the 400 only has one cartridge, and could occupy 8000-BFFF (16k)
or A000-BFFF (8k).

If you need any more specifics, I will look them up for you.

Austin

The XEGS contains a single 256k ROM that is 128k of OS, 8k of missile command,
and 8k of BASIC. There are extra select lines on the 20 pin MMU to switch back
and forth between them.

The device has the same pinout as a 27256 eprom, so it should be easy to
read and replace.

>>But then again, Zero 5 is not such an old game, and it's still available. I just mean I wouldn't pay $50 for Pole Position, even if I love the game. I got 2 shrinkwrapped ones and 1 I use. I paid about $5 each or so. That's fair and even if Atari charged $50
or whatever (I live in Norway, so I don't know) 15 years ago, that game has been sold for many years for less.

>>That's what I meant by I'll pay $50 for Starfleet I, because I love the game and I think it's worth it. I don't think Pac-Man is worth $50, if you see what I mean. I love Pac-Man too and got it on my shelf for $2 or something

I see your point; honest I do. And I agree with you.

I was just taking issue with the fact that a lot of people are in the mindset that just because something is old its not worth anything (or much). If I had just purchased an 8bit system and came across a copy of Printship at a retail store (there are a few that still support Atari...grin) for $20 I'd buy it. It would be worth it to me. Just because its an old program doesn't it should be in the 99cent bin or given away.

As for Zero 5, you are right in that itsa pretty new release. But you wouldn't believe the amount of people who won't buy it at the $59.00 asking price. They will use the argument that "Hey, its for a dead system and no way should a program for a dead system cost more than a game for the Playstation or Nintendo". Sorry, just because its for a "dead" system, doesn't mean that there aren't costs involved in producing it and distributing it just like there are for Playstation and Nintendo games. The authors of Zero 5 worked on their program just as hard as those that wrote Diddy Kong Racing and deserve just as much compensation.

Sorry, I wasn't coming down on you and if it appeared that way I apologize. We really agree on the subject I believe. After all, you'd pay $50 for a 20 year old game.

Thanks, Richard, that's the kind of info I was looking for. I was
uncertain because I didn't know if there was any problem with

directing the SIO output to 2 simultaneous devices. You know, the same kind of problem with hooking up 2 stereo speakers to one speaker jack. It's a impedence problem that has nothing to do with being a bad hack. I wasn't trying to say that it would keep you from being able to daisy-chain; I was just trying to express my concern that my solution might burn out an Atari if you were using real drives at the same time as SIO2PC. My apologies for not being too clear on that.

As long as there is no ELECTRICAL problem with hard-wiring an SIO2PC cable to the inside of the SIO port, I don't see any reason that it shouldn't work. There, is that better?

I used mine in college as an alarm system. I ran some wiring up to
the door in my dorm room that was connected to the joystick port, and
when someone opened the door, it broke the connection (which changed
the stick(0) value), which triggered a sample of my very loud roommate
screaming (using the Parrot software). I had this whole BASIC program
setup that would check how many times the door opened during the day,
and at random intervals it would sound off the scream. It used to
scare the crap out of everybody!

Yeah, I know it's not a "good" use for my Atari, but hey, it was
college!

I've got two paddles with bad pots in them. Does anybody know how (or have some plans) to replace the pots? What kind do I need?

Anybody got any ideas?

Thanks,
Steven

>

In the US, price and value are determined by how many people are still buying a product, in any market, not just computers. It's simple economics: when the demand is high, so is the price. When the demand falls off, vendors drop the price to entice more buyers. When the demand disappears, so does the product. The problem is, software isn't like other products. Since it can be copied (usually very easily), it doesn't really have a lifespan. The medium may fail, but as long as there is a backup, a copy can be made on a new medium. So a 10 year old program isn't like a 10 year old vacuum cleaner. No one thinks twice about junking an old vacuum cleaner to buy a new one, but we'll hang on to software for as long as we can, using any means necessary. Its market value has diminished, but its personal value has not. Personal value does not determine market price, but it can and will determine collectors' price.

Hardware is different. Parts fail, new technologies emerge, faster systems take over. The computer itself is like the vacuum cleaner. We'll update our machines as long as we can, and then when we can go no farther, we'll get rid of them in favor of new hardware. Some will sell, trash, or give away the old systems. Others, like myself, will hang on to it, maybe put it in a back closet. When the nostalgia for the old system occurs, we drag the box out of the closet, hook it up, and then we might want to see what other software is out there. Since it's no longer supported by the original companies, what's left to do?

People who continue to sell software that is no longer officially supported by the original companies do so because there is a collectors' demand for it, not because of its market value. Go to a flea market and look at how many people sell bootleg music tapes. Make a note of some of the titles, then go to your local music store and try to get an "official" copy of the same tape. In some cases, you might be able to, but I would bet that in most cases, the music store doesn't carry it anymore. Why not? Because it has no market value. That doesn't mean it's not copyrighted, so why can the flea market vendor get away with it?

Ok, ok, so you will say, "But the software vendor is selling original titles, not copies!" This may be true, but the software vendor bought the titles from a company that no longer supports them. In any

market, when a company drops official support of a sold product, the vendor is stuck with a finite supply of product, which makes it a collectible. In order to continue to provide the product, the software vendor must either find other sources, who are also stuck with finite product, or the vendor must make illegal copies. Otherwise, when it's gone, it's gone. After 10 years of finite product, how much of it do you really believe is still "original"? And how much of the money being generated from the sale of "original" software do you believe is going into the pockets of the ones who wrote the software? If the original copyright holder is still making money off of the sale of the software today, then copying that software would be an infringement of its copyright. But if the copyright holder cannot make any more money by trying to sell the product, what lawyer do you believe will even want to look at a copyright infringement case, let alone try to argue for it?

Atari 8-bits may have died because of the rampant copying that went on in the '80s. But here in the late '90s people are copying software to keep the systems alive. They are collectibles, and if people want to spend money for them, then there will always be someone willing to sell it to them to make a buck. It doesn't make it legal, but if the original copyright holders don't speak out it's going to continue to happen. And if they don't speak out, then maybe the US public needs to speak out to get the copyright law changed to exclude copyrights on products that are no longer on the market. After all, we, the people of the United States, should be able to decide what is law and what is not.

Whoops, somebody just kicked the soapbox out from under me...

Message-ID: <01bd58fc$84240d40$0cd13ace@techmedia---bob>
Source record: 64348

We are in need of switch-type joysticks.

Our company manufactures products that use this old Atari style joystick. The joysticks have switches inside of them that represent up, down, left, and right movement. The connector should be a DB9 (female). We have used Suncom Tac50 joysticks in the past and we could probably use just about any old Atari or Commodore 64 switch-type joystick.

If you have any information about where to locate these joysticks or have some in new condition that you are willing to sell, please contact me at rgately@dnc.net or 503-684-6006, ext 148.

Thanks

Bob Gately

No, Michael is right. Whatever ad you saw must have been for their
LICENSED VERSION of Defender. Williams still owns Defender; in fact,
they released their own emulator a few years ago to play Defender,
Defender 2 (Stargate), Joust, Robotron, Sinistar and Bubbles, using
the original code from the ROM chips (similar to what MAME does).
They released it for the PC under the name "Williams Arcade Classics."

3290. SIO2PC & Atari Peripheral Emulator (A.P.E.) 1.16

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-26 00:00:00 UTC
From: NOSPAMronwizbot@juno.com
Message-ID: <351ad480.17505615@news.ou.edu>
Source record: 64350

The SIO2PC is just a level converter, BUT: with A.P.E. 1.16 it allows you to use your PC to mount virtual disks (*.ATR, *.PRO, etc) and load from the PC. This saves wear on the Atari Floppy drives.
You can save floppies to *.ATR files on the PC, or vice versa.

I discovered this past weekend that it allows a Print-through from my 130XE through my 386 PC to my Star NX-10 dot matrix printer. This feature was there all along, but now that I know it is there, I can put my ICD P:R:Connection on a shelf or sell it (anyone interested????).

I didn't realize the quality of Steve Tucker's software until I was able to give my kids printouts from the old Atari using the Print-through method. The real beauty of this method is the speed. It uses the maximum SIO bus speed (whatever that is) and spools faster then the P:R:Connection ever did. I guess it also buffers it all in the PC memory to speed up the spooling.

I wonder if Steve likes this free advertizing?

A.P.E. 1.16 and the SIO2PC (schematics or assembled units) can be found at

http://seka.nacs.net/~classics/

Ron

(remove the NOSPAM from my e-mail address if you want to make an offer for the ICD P:R:Connection via e-mail)

Even if you can split the joystick cables to have 4 joysticks, how could you read them? location 54017, (I think that was JOystick 3 and 4??) can be changed on the XL/XE line to control bank switching for extended RAM. I guess you could write some custom code to access the two joysticks from one joystick port, but I don't see how you would do it. How would YOU do it?

I beleive an original full version of Ball Blazer wouldn't boot properly
on my Xf, as well as some other (not so popular commercial software) But
ANY SS/SD or SS/ED disk formatted on my XF551 could be read by the 1050 no
problem. Unless you are formatting double sided and/or double density,
the 1050 should be able to read it. I know the unmodified Xf551 could nto
format side 2 of most floppy disks, unless it had a 2nd timing hole.

I never said not to appreciate the older technology.. I said to just keep up with the times.. and I still have 4 old atari's. and even drag my amiga out every now and then!!

and a REAL simple solution, is VERY easy to implement whoever you are, and costs absolutly nothing!! use a filter!! just filter out the people who's posts offend you!! then there's no additional cost, and you won't haver to constantly bug them... I persoally, have seen some GREAT html posts on other groups, as they can link to a web page, and inclue a picture link, without downloading the whole blamed thing first!!

I 've found some great pics people have sent me that way, and even got a atari atr or two that I couldn't find..

So, in summary, filter out the people who's posts you don't like, and that will also reduce the bandwidth for those international users who have to pay so much for this ability...

Now is that SO hard to do?? And wouldn't that save EVERYONE here alot of time, and trouble?? and it also solves the problem for those that DO want to use it...

I pretty much always use my filters to filter out unfair sellers and such.. and offending posts..just do the same, and get over it!! ;)

Here we go again. This question gets asked a lot in the newsgroups for "commercially obsolete" systems.

Technically, they are right.

Legally, piracy is piracy.

Morally, as long as there are *no* commercial vendors who are selling the original product and there are no plans to re-issue the software, I don't really think piracy is hurting anyone and I'd soften my stance.

As a programmer myself, I have absolutely *no* tolerance for people who pirate software which is still available. That is truly stealing the fruits of one's labors where those labors are still capable of making money for the original programmers. As for copying old 8-bit Atari stuff, or Apple][stuff, or old Commodore 64 stuff...well, it still isn't legal, maybe not completely right, but as long as one can honestly say they would pay for something they want to use if they had a chance to actually buy it, I hardly think it's worth prosecuting.

I recognize that position doesn't exactly comport with the law, but ethically I don't think copying some game disk that hasn't been available commercially for ten years is hurting *anyone* in any real way.

Personally, I wish there was a way to track down all the copyright holders of most once-popular software, create some disk-copying "co-op" which could sell disks and photocopied docs for a reasonable fee (like $10) and give a couple of bucks from each sale to the copyright owners. This would be my ideal solution if it were feasible.

SpannerWerksï¿½ ï¿½Jeez, I still have that?!?ï¿½ Auction

Just a little auction to clear out the Atari ST & 8 bit debris in my
room.

AUCTION RULES:

1. Standard rules apply. Please mark all bids with the subject line
"Auction" so I can quickly separate them from other emailsï¿½messages so
marked will get first priority!

2. Items will start a Going, Goingx2, Gone phase Friday, April 12th.
At this time, items' status will change after every two-day period
without
a raised bid. If an item fails to attract the assigned minimum bid by
Sunday April 5th, it will be pulled from the auction.

3. Minimum raises in bids are in $1 increments.

4. Updates will be posted every other day to both the newsgroup and the

participants. Please let me know if you wish to be taken off the
mailing list for the auction. I will only confirm bids by email for the
highest
bidder on each item.

5. Only the highest bid will be listed. On tie bids, the first one
received will be registered as the high bid for that item.

6. No lot bids except for the items already listed as lots.

7. Payment must be made by money order or personal check. If you're
bidding on more than one item you may pay for all your items at once.
However, if after two weeks following confirmation of final total I have

not yet received your payment, the items are forfeit and the next
highest bidder will be contacted.

8. Shipping will be by USPS or UPS, whichever is cheaper for you if you
have no preference. Prices do not include shipping. Prices are un US
dollars. International bids OK.

9. Detail on condition of item available upon request. Let me know if
you have any further questionsï¿½thanks!

The items:

ITEM Min Bid Curr Bid/Bidder

520STm (1 Mb) $10 102063.112/$11
w/ PS, Mouse &

How is copying software that is no longer commercially available any
worse than checking an in-print book out of a Public library and thereby
"cheating" the author and publisher of revenues.
It seems to me to be hypocritical in decrying copying of old software
while having no problem with taking new books out of a library.
My .02 worth.

>It seems to me to be hypocritical in decrying copying of old software
>while having no problem with taking new books out of a library.

The difference is:

Library books are loaned. Every copy was originally purchased from the
publisher.

Pirated software is copied. One copy originally purchased from the
publisher is used to produced unlimited copies for people who don't feel
like paying for it.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

SpannerWerksï¿½ ï¿½Jeez, I still have that?!?ï¿½ Auction

Just a little auction to clear out the Atari ST & 8 bit debris in my
room.

AUCTION RULES:

1. Standard rules apply. Please mark all bids with the subject line
"Auction" so I can quickly separate them from other emailsï¿½messages so
marked will get first priority!

2. Items will start a Going, Goingx2, Gone phase Friday, April 12th.
At this time, items' status will change after every two-day period
without
a raised bid. If an item fails to attract the assigned minimum bid by
Sunday April 5th, it will be pulled from the auction.

3. Minimum raises in bids are in $1 increments.

4. Updates will be posted every other day to both the newsgroup and the

participants. Please let me know if you wish to be taken off the
mailing list for the auction. I will only confirm bids by email for the
highest
bidder on each item.

5. Only the highest bid will be listed. On tie bids, the first one
received will be registered as the high bid for that item.

6. No lot bids except for the items already listed as lots.

7. Payment must be made by money order or personal check. If you're
bidding on more than one item you may pay for all your items at once.
However, if after two weeks following confirmation of final total I have

not yet received your payment, the items are forfeit and the next
highest bidder will be contacted.

8. Shipping will be by USPS or UPS, whichever is cheaper for you if you
have no preference. Prices do not include shipping. Prices are un US
dollars. International bids OK.

9. Detail on condition of item available upon request. Let me know if
you have any further questionsï¿½thanks!

The items:

ITEM Min Bid Curr Bid/Bidder

520STm (1 Mb) $10 102063.112/$11
w/ PS, Mouse &
Astra EasieST
Solderless RAM
Expander (up to 4mb,
512k installed)

SM124 monitor $10
(curving lower
left corner)

SF 354 FDD $5
w/ Cable &PS

SF 354 FDD $5
w/ Cable &PS

IB Drive 5.25ï¿½ FDD $10
w/ integral cable, Manual &PS

Iain, you might as well give it up. No matter how you try to explain it, there'll always be some people who just don't get it. They'll be the ones who don't realize that a writer is supposed to tailor his message to his prospective readers, not the other way around. Every person who posts a message here is a writer, no matter what the talent, ability, or skill level he posesses. Writers write to be read. All messages here are meant to be read, else why post them?

If a writer wants to limit his readership by using a format he knows many can't use, or don't want to be bothered with, well, I guess that's his choice. I can ignore a limited amount of this stuff; I can be annoyed with a higher level of it and still live with it; and there is a level of it where I will simply leave the newsgroup for a more compatible pursuit.

It just seems to me that a newsgroup dedicated to a Classic Computer ought to retain a format accessable to users of that computer, and that those who choose to continue using that computer shouldn't be condemned for that choice in this one group, at least.

Then again, what do I know? I'm still stuck in the '80s.

>you read them?

He said it uses the POT lines, I guess for the second joystick, so
he gets one digital joystick and one analog joystick hooked up to
the same port. Though, I think that still leaves only one line for
a trigger, so simple maze games would be doable, but shootem-ups
may not be so practical (unless the idea is that one player runs
away while the other blasts away.)

.... On the multi-player topic, wasn't there a paddle controlled
game on the 8-bits that allowed 8 players to play at once?

: Anybody got any ideas?

: Thanks,
: Steven

Unless you can find exact replacements or a general replacement type with the same style shaft, you might not be able to use the original knobs. But I have a set of Gemini paddle controllers that use 1 megohm linear pots. A generic replacement type like Radio Shack 271-211 might work. Before you replace the pots you might try a contact cleaner spray. It might improve operation unless the pots are just plain worn out.

Three sizes of text. Ability to change graphic modes on a single
screen, the ability to scroll text. This is a character generator with
a good basic program.

>Just asking, but what is the "policy" among Atarians about "copied" stuff?
>I called the SPA to ask and they said "Nope - the copyright is good for 70
>years." What does everyone else think?

Point taken. I first bought my Atari 800 in 1981. During the years that I used it before relegating it to the closet, I had only original, legal software. This mass of equipment that I obtained came with the pirated programs.

Let me re-phrase my original post to say that I have a multitude of hardware, magazines, and some original software. I also have a lifetime supply of freshly formatted double density 5 1/4 inch floppies which I will keep. I find that with minor modifications, they make servicable frisbees.

Steven,
It was useful to you and YOU built it yourself. That's the SOUL of the
Atari 8-bit in action. Simple? Yes. But that's the stuff that makes
using the 8-bit worth having it in the first place. Keep having Atari
fun!!!

ALL,
TCF (The Trenton Computer Festival) is the oldest US East coast
computer fest. It is also one of the biggest with about 18000 attendees
every year, over 200 vendors and lots of talks/workshops and forums, and
a treiffic flea market.
I will be hosting the Atari 8-bit user forum on Sunday afternoon. Check
it out!!!
For TCF info and directions, check out www.tcf.net.

Hi all /|\ fans!

I'm happy there are people still using "old good" atari.

I would like to connect atari 800 xl to our svga monitor. It doesn't mind if it'll be black/white (monitor isn't color). I prefer this before buing tv box or another monitor.

Please, post some solution how make it...

Thanks a lot.

If you have the Atari850 module, or better still modify the SIO2PC cable.
It should be possible..

a. If you can use a soldering iron.
b. If you can locate a supplier of miniature-Din connectors.

Then do serial transfer (using Clarisworks) thru printer port on the MAC.

If you need more info then email also.

hope this helps,
WazzdOrf AT aol DOT com

Thanks for the quick reply. :) But what's the chip number?
+
Where's the excess code? 200k is a lot of extra code for an 8bit, comparing the
XE-GS with a normal XE ROM there's only minor differences, mainly the ROM
checksums used in reset/power-up sequence.

Any Ideas? :)

cheers,
WazzdOrf.

Yeah, they're pretty worn. I've tried the spray stuff and they still
return some pretty funky numbers. I have a feeling it will cost less
to find some working used ones than it would to fix these.

Thanks for the info.

Steven

it has something to do with the fact it has a built in game not a translator problem. I have APE warp os, So I could play the 400/800 and the xl/xe games one one system without loading software. Does anyone know how to disable the missle command game(use a switch to go back and forth) I have been told the game will not run for the same reason it will not run on a system with expanded memory. What ever that may be.

I have a electronics back ground, but have only opened an atari up once so I have no idea what make the atari tick. Besides from a 6502 cpu.

Thanks everybody for the great replies. I'm proud to say that I have written my first Atari program. Surprise! It's a phonebook. It was great fun. Up to this point I really hadn't done anything that involved writing to disk, but I seem to have done it. Yeah, it's only sequential, and I only use PRINT # and INPUT #, but it gets the job done. I wrote it using Turbobasic 1.5, which, by the way, has INKEY$ to get the last keypress, pretty cool.
I really enjoyed being able to DUMP"E:" also. I doubt I would ever be able to use plain old Atari basic again.

Eric

The only way I know how to do this is to get a TV to PC converter
card, and view the Atari video through your PC. It would probably
cost more to do that than it would to find a good used TV or base-band
video monitor.

SVGA is totally incompatible with the video output of the Atari. Any
solution others may come up with might also be equally as expensive.

I would suggest that you start searching for a Commodore 1701 or 1702
monitor. My 1701 is still running like new after 15 years!

Good luck!
Steven

Oops, I meant 128k bit (16kB) ROM. 64k bit (8kB) BASIC and 64k bit (8kB) MC. :)

The part # is C101687

A common fix for dead or 'shakey' paddles is to spray out the pot with
some lubricant like wd-40. Flushes out the dirt and makes them like new. If
the pot is actually bad your better off just getting another set of
paddles, they sell in many of the newsgroups for as little as $1-$2 a pair.

>they released their own emulator a few years ago to play Defender,
>Defender 2 (Stargate), Joust, Robotron, Sinistar and Bubbles, using
>the original code from the ROM chips (similar to what MAME does).
>They released it for the PC under the name "Williams Arcade Classics."

For Atari to have so vicously defended their rights to Defender they probably had some kind of major deal with Williams. After all, think about it ... at the time, they were only producing the 2600 and 8-bit versions of the game. Other Defender clones came out for non-Atari systems but I'm pretty sure that NONE were called 'Defender', meaning that Atari had secured sole rights to producing official home versions of the game.

If Hasbro has bought the Atari name and everything that goes with it, Defender will be amongst the titles they've got their mits on unless Williams had a clause with Atari that meant that full rights to home versions passed back to Williams if Atari changed ownership. Since Atari themselves never officially went out of business then such a clause wouldn't have been envoked. If you're not convinced, how about Phoenix and Galaxian? Phoenix was produced for the arcade by Taito (I think), can't remember who did Galaxian but I'm pretty sure it wasn't Atari. Berzerk is another non-Atari title I can think of.

Michael is almost certainly correct with his suggestions. In fact, looking at the posting again, I can see very little difference between what WSJ had to say and what Michael said except perhaps that Michael seemed to be suggesting that WSJ had got it wrong by claiming that Hasbro had bought ALL rights to the two games mentioned.

Anyway, even if Atari had sole rights to the home produced versions of Defender, Williams could conceivably have been walking on thin ice with their Arcade Classics since they would have been treading on Atari's turf. I suspect that had Atari taken them to court for breach of contract it would have made a very interesting contest ... which Atari would probably have lost since Williams went through the back door by writing an emulator that would allow them to sell the games as they were originally written for the arcade.

3335. XEGS Missile Command in analog trackball mode?

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-28 00:00:00 UTC
From: asl00@eng.amdahl.com
Message-ID: <EqIE2E.FC3@ccc.amdahl.com>
Source record: 64296

I've been playing Missile Command on my XEGS lately and wanted to use my trackball in analog instead of joystick mode. This doesn't seem possible after toggling the options and select buttons. Any suggestions?

The 5200 version with a 5200 trackball (which is intrinsically analog) seems to be the best combo.

TIA.

The built-in version of Missile Command in the XEGS is missing the
Control-T function to toggle the true trakball mode on or off. You'll
need to find a cart version.

I've played the built in Missile Command on 2 XE systems that I've owned with a track-ball in true analog mode. Are you sure the switch on the back of your track-ball is set to TB (track-ball) and not JS (joystick)?

Wow! This thread can really branch out.

Suppose we all agree (just try that!) that a newsgroup devoted to a classic computer shouldn't necessarily be readable by those who use only that computer. What would that do to those who use only their 8-bits?

Another OHAUG member wrote an e-mail to me yesterday that advocates a mass return to BBSs because they can be accessed by _ANY_ computer. If that doesn't buck the flow, what does?

But think about it. In the same message, the guy talks about hooking up all of the PCs (plural noted) and Ataris (plural noted again) in his house in one grand serial intranet. I can't argue with that; I use SIO2PC and null-modem between my one PC and my one set-up Atari all the time.

Where the ____ are we going?

3341. Auction: Atari 8-Bit Computer Manuals/Magazines/Controllers

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-28 00:00:00 UTC
From: clauction@aol.com
Message-ID: <1998032812422400.HAA22030@ladder03.news.aol.com>
Source record: 64302

April Auction - Update 4

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, April 6 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

There also exist plans for a single chip SIO to RS232 converter that will let you run at 9600+. If you're handy with a soldering iron and have a spare SIO cable to sacrifice, it's the way to go.

The paddle controller returns a value from 0-127, right? That's 7
bits of resolution. There's two of those per port, plus 5 digital
inputs. Hence, it is intheory possible to have 19 independent digital
lines per port. That's enough for 7 digital joysticks on an XL/XE or
15 on a 400/800.

Of course, the circuitry to multiplex 7 digital lines into a single
resistance level would be a bit tricky, and I'm not certain how
precise the Atari is at reading resistance values, so it might not
work that well.

Still, you should be able to hook up 3 joysticks per port. It would
take more than just a splitter cable, and it would require special
software on the Atari end, but it would be fun to do.

Now if you added a restriction that you can't move left and right at
the same time (or up and down), then instead of 5 independent digital
signals, you have one binary signal and 2 tertiary(? base 3) signals.
This could be represented as a value from 0-17. This would allow for,
in theory, upto 30 joysticks on an XL/XE or 58 on a 400/800, though
that assumes you split the signals across multiple ports in some
cases. :)

I am sure that a mass return to BBS's won't happen in the near future. I still see a need for the BBS per say. I am in the middle of setting mine up again. Actually I am looking forward to it! Some users do not have access or perhaps have no desire to access the net for one reason or the other. There are still many computer users that do not even use modems for that matter. Personally I have not been to thrilled with what I have seen happen on the internet. This does not mean that I think it should be abandoned either. I do beleive that if one is going to use the internet on such a global level that they all need a way to communicate with one another. From the little ol 8-bit to the PC. HTML may surely have a place on the net, but it is not in the newsgroups at this time..... It is hard enough trying to cross language barriers. Hey it is just a though for the time.

>Any and all replies welcome here...

Mike Hohman is the guy who bought the rights to SpartaDOS and a pile of other ICD stuff. Unfortunately, it seems he got in way over his head with other projects he was working on ... including his MIO II, an IDE hard disk interface. I was one of the suckers who trusted him to come up with the goods and paid him in advance for an MIO II. That was three years ago!

What's really annoying is that he had prototype units working satisfactorily but he kept wanting more time to do an even better job (like adding true 16-bit support ... his original design was only 8-bit and could therefore only access half the full drive capacity). I would have been quite happy with the device as it was, so long as it did the job ... how the hell am I going to fill up a 540Mb drive on an Atari for crissake?

Anyway, it's water under the bridge. I don't really care that much. Even if I did there's nothing I can do about it.

We're getting a bit carried away here, aren't we? :)

I did toy around with the idea of adding more joysticks but you hit the nail on
the head with the problem of resistor accuracy. I never actually tested the
unit properly and so I don't know just how far the values will be off. Three
connectors on each port should be feasible but I wouldn't attempt to go further
than 5 or there'd be no room for an acceptible margine of error.

In short, with a joystick splitter designed around resistors, the fewer additional ports used, the easier it will be to write code around the flaws in such a system.

BTW: It's also possible to daisy chain such a device together, but it will require cleverer programming.

If there's enough interest (there seems to be), I'll build a new splitter or two and publish the results and suggested parts list/construction details on the Web. It's better that any splitter cable conforms to one standard for software development purposes.

I'd especially like to hear from any programmers who'd like to be able to support more joysticks. I've still got a couple of multi-player projects on the drawing board from when I had my programmer's club.

I'm no longer going to attempt to write 8-bit software on my own. Too much hassle, too little time.

I have three cassettes for the Atari 8-bit that I would like to trade
for Lego. The cassettes are:

Writing Programs 1
Writing Programs 2
Introduction to Graphics

The tapes are in great condition and load well. If you have a Lego set
that you would like to trade, please e-mail with with the set number and
we will arrange to make the trade. Thanks.

<quoted html mime postings deleted>

Some news readers cannot be configured to ignore any MIME types, as some
nesreaders have no knowledge whatsoever of MIME encoding. These
newsreaders are quite prevalent in the Unix world, where many people
read and post USENET news, and indeed where USENET news has its roots.

In some cases, there may be external MIME decoders/interpreters which
can be called into play, as external file processing pieces, but this is
an extra step, time consuming and frequently awkward.

The fact of the matter is that USENET news is NOT designed to have any
non-text in normal articles, other than those in binary groups where
postings of UU encoded (or somewhat less common, and not as accepted,
base-64 encoding) is accepted and routine.

the 65816 runs exactly the same as the 6502 if the clock speed and
software are not changed. otherwise, you could pump up the system some
by re-writing the 8-bit routines in 16-bit codes. none of my Sweet16
upgrades are bulletproof - they either fail with PBI devices or don't
work with an IDE interface or something. they do work OK as just a
drop-in.... this can all be fixed, but it will take some time. I'd
really like to get them running at 4x clock with 512K of linear RAM. you
really wouldn't need any software changes to crank up the system that
way.

SpannerWerksï¿½ ï¿½Jeez, I still have that?!?ï¿½ Auction

Just a little auction to clear out the Atari ST & 8 bit debris in my
room.

AUCTION RULES:

1. Standard rules apply. Please mark all bids with the subject line
"Auction" so I can quickly separate them from other emailsï¿½messages so
marked will get first priority!

2. Items will start a Going, Goingx2, Gone phase Friday, April 12th.
At this time, items' status will change after every two-day period
without
a raised bid. If an item fails to attract the assigned minimum bid by
Sunday April 5th, it will be pulled from the auction.

3. Minimum raises in bids are in $1 increments.

4. Updates will be posted every other day to both the newsgroup and the

participants. Please let me know if you wish to be taken off the
mailing list for the auction. I will only confirm bids by email for the
highest
bidder on each item.

5. Only the highest bid will be listed. On tie bids, the first one
received will be registered as the high bid for that item.

6. No lot bids except for the items already listed as lots.

7. Payment must be made by money order or personal check. If you're
bidding on more than one item you may pay for all your items at once.
However, if after two weeks following confirmation of final total I have

not yet received your payment, the items are forfeit and the next
highest bidder will be contacted.

8. Shipping will be by USPS or UPS, whichever is cheaper for you if you
have no preference. Prices do not include shipping. Prices are un US
dollars. International bids OK.

9. Detail on condition of item available upon request. Let me know if
you have any further questionsï¿½thanks!

The items:

ITEM Min Bid Curr Bid/Bidder

520STm (1 Mb) $10 102063.112/$11
w/ PS, Mouse &
Astra EasieST
Solderless RAM
Expander (up to 4mb,
512k installed)

SM124 monitor $10
(curving lower
left corner)

Source record: 64320

I just spent the last few hours of so copying my old SD disks to my PC, and surfing them. Man, it brings back memories.

But, ominously, it looks like my 1050 is getting sick- and I still have a bunch more to do!!

Having rolled my own cable and disk emulator software (finally a good use for a PC)- its lots faster than the OEM drives. My question is how fast are the SIO2PC / APE alternatives? Maybe a decent measure is how fast a stock 800 can boot to the DUP menu without basic using them.

Do SIO2PC / APE properly emulate bad sectors, so copy protected disks can still run after being copied?

Also, it seems like Datasoft wrote/sold a lot of software for the Atari line. What ever happened to them?

Thanks,

Gregm

I dont think Hasbro will re-introduce the 8bit Atari to the world. Im sure you can see the world is 32-64bits at this point. They may do a production run on the classic 8bit at some point, like Radio Shack did on the TRS80 a while back and Stamp the box Classic Edition.. Dont take this message wrong, I've been an 8bit user since 1980 and have a FULL-BLOWEN 3 node LAN system in my livingroom running Star NET BBS in Orlando FL. and I continue to enhance and upgrade the system at a RECORD pace.

It would be nice to see the 8bit return, I just think there are not many 8bit user still around for Hasbro to make money with it.

The demo picture is the only thing that has ever been published. Winter Games itself has never been released for the ATARI 8Bit. However, you can get it for the ATARI ST. Some people still confuse ATARI 8Bit with ATARI 16Bit and vice versa, so that's why some people claim they have a copy.

There is no such thing as WINTER GAMES for the ATARI XL/XE! The best game that comes close to it is WINTER OLYMPIAD!

If you would really like to play WG, go and get a C64, ATARI ST or AMIGA emulator and a copy of the game.

CU!

Any chance of you going the whole hog and implementing the enhancements in the relatively near future?

How much does the current Sweet 16 unit cost?

Just thinking ... I remember talk a few years ago of an upgrade to the GTIA chip (I think) that upped the maximum available colours to over 4000. With something like that in place, and a Sweet 16 running alongside it, there could be life in the old Atari yet - plus with the added advantage of backward compatibility. Add more memory, of course and add a stereo pokey upgrade and you have the makings of the first viable sub $200 home computer for quite some time.

All it needs is for some enterprising person to go ahead and reverse engineer the original 8-bit (shouldn't be difficult) if Hasbro decide not to do anything with the hardware.

Anyway, Bob, do you have any idea what the GTIA upgrade was? Wasn't one of yours, was it?

I used to have Winter Olympics/ Winter Olympiad game for the 8bit. It was
4 disks long. i think made by tynesoft. I think it was designed for PAL
systems, because it was crash a lot of my machine. The game looked "cool"
but really wasn't very playable at all. Most sport games on the Atari
8bit fell short of expectations. (Anyone care to argue this point?) With
the exception of maybe One on One basketball and Leaderboard Golf, Atari
8bit sport games stunk.. (from what I have seen)

A "WINTER GAMES" game I beleive was released for other platforms, not the
8bit. But the previous game I mentioned is as close as you will get.

I think CHICKEN! used 4 players.. not necessarily at once though. And it
was a paddle game. I think there is a FAQ on 4 player joystick/paddle
games. I would like to know all the over the modem games for the 8bit
that are out. To my knowledge, I am just familar with cross-town
crazy-eights and a simple basic game where you calculate trajectories and
try to blow up the other guys castle..

> >location 54017, (I think that was JOystick 3 and 4??) can

> >I guess you could write some custom code to access the two joysticks from
> >one joystick port, but I don't see how you would do it. How would YOU do
> >it?

Some other e-mails later (which I never bothered to quote, because my
e-mail system does not allow you to quote messages that are larger than
what you type. (I know sounds silly, but I guess there is a logical
reason behind that.. (1) save space and (2) discourage mass-quoting,
chain e-mails...), mentioned that you could conceivable have more than 4
joysticks hooked up, depending on the 8bit resistance tolerance.
Everything in theory looks good, but until some concrete hardware hack and
appropriate software is written, it's only theory!

Hi,

I haven't posted here before but I have a question. So far my xe gs has been turned into a lumbering wood platform with a plastic garbage can body. I also have mounted a radio shack mobile armatron on top of it. The armatron is the type which is easy to interface to a computer. I decided that I want to connect it to the computer as a serial device because the joy stick ports are being used. How can I do that? Can I just use a shift register and l-print the necessary ascii characters? I don't know how the daisy chaining is handled or what the computer expects. I read brief article on it somewhere but I'm not conversant in technobable :-) If I need to I can connect the arm to a microcontroller, possibly the hc11, and use it to communicate with the computer.

Please reply via e-mail as well.

Thanks,

You might get away with sending serial data using the peripheral
MOTOR control line. This is only possible if you no longer use cassettes.
Alternatively, if you don't use any intelligent devices such as Disk or 850
serial i/f.
but you use cassette then the peripheral command line would be available.

bit 3 of Port A control @ $D302 for Cassette Motor
bit 3 of Port B control @ $D303 Command Line

Based on what you intend to do, I would urge you to opt for the Motor control
line, because it has a capacitor protecting the PIA chip.
Alternatively, get hold of an 850box you can then use the parallel printer
connector.

Good Luck! :-)

There are several Winter Games clones for the Atari 8-bit:
- Winter Olympiad '88 made by Tynesoft with good graphics and great music; I think it was released in the US as Winter Challenge
- Winter Olympics, also released by Tynesoft, is an earlier version of the above title
- Winter Events by Anco, a pretty decent game.

Winter Games was announced twice for the Atari.
Once by Epyx (it should've been released along with Summer Games II, which didn't make it either) and once by Atari in cartridge format for the XEGS; it's really strange because I have a picture of an XEGS with a TV set running Winter Games!
Maybe there's a beta version somewhere...

SpannerWerksï¿½ ï¿½Jeez, I still have that?!?ï¿½ Auction

Just a little auction to clear out the Atari ST & 8 bit debris in my room.

AUCTION RULES:

1. Standard rules apply. Please mark all bids with the subject line
"Auction" so I can quickly separate them from other emailsï¿½messages so
marked will get first priority!

2. Items will start a Going, Goingx2, Gone phase Friday, April 12th.
At this time, items' status will change after every two-day period without a
raised bid. If an item fails to attract the assigned minimum bid by Sunday
April 5th, it will be pulled from the auction.

3. Minimum raises in bids are in $1 increments.

4. Updates will be posted every tuesday and thursday to both the newsgroup
and the participants. Please let me know if you wish to be taken off the
mailing list for the auction. I will only confirm bids by email for the
highest bidder on each item.

5. Only the highest bid will be listed. On tie bids, the first one
received will be registered as the high bid for that item.

6. No lot bids except for the items already listed as lots.

7. Payment must be made by money order or personal check. If you're
bidding on more than one item you may pay for all your items at once.
However, if after two weeks following confirmation of final total I have not
yet received your payment, the items are forfeit and the next
highest bidder will be contacted.

8. Shipping will be by USPS or UPS, whichever is cheaper for you if you have
no preference. Prices do not include shipping. Prices are un US dollars.
International bids OK.

9. Detail on condition of item available upon request. Let me know if
you have any further questionsï¿½thanks!

3375. Re: what modem interfaces r available?

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-30 00:00:00 UTC
From: stronae@rice.edu
Message-ID: <6fn9jjgvo2@joe.rice.edu>
Source record: 64186

David A. Paterson (davepat@total.net) bequeathed:
: There also exist plans for a single chip SIO to RS232 converter that will
: let you run at 9600+. If you're handy with a soldering iron and have a
: spare SIO cable to sacrifice, it's the way to go.

Where would these plans exist? I am very interested in connecting my
external 14.4 to my Atari. Please e-mail back, as I don't follow newsgroup
postings often...

Thanks,
Kenneth

Would like to buy Sea Dragon and ApplePanic games on diskette for the
Atari 800.

We lost our copies and want to play this game again.

Please respond to us via email at chandero@goes.com

Thanks for any help.

April Auction - Update 5

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, April 6 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

Mathy,
Sure! That's a rather simple interface. The timing and data may be a
bit more difficult to deal with though. Basically, you need a
laser-diode for transmit and a photo transistor for receive (fited with
the appropriate connectors (ST or SC)), joystick connector, a couple of
resistors and some programming to read/write to the joystick port. The
BB is nice, but certainly NOT neseccary for this to work. It's a simple
bi-directional serial interface. One JS pin rot read, one JS pin to
write, one each JS pin for +5VDC and Gnd.
Like I said, the programming to match the other end is going to be the
hard part. Clocking fast enough to move data around.

Howdy Robert

Either I'm not understanding you, or you're not understanding me, but...
What the joystick gotta do with this?

What I'd like to see (somebody else develope, cause I don't know enough about
electronics) is a way to disconnect the BlackBox from the computer, while still
being able to use the two together (while "unconnected").

I've thought about IR and Radio waves, but that's to much error prone (to many
outside influences). So I thought light via fiberglas would be cool.

The XE has 34 pins on the Cartridge port and 14 on the ECI (we need both for
PBI devices such as the BlackBox). We don't need to send power and ground over
the wire. With the right light source, you wouldn't need one fibre per signal.

BTW it could be done with flatcable and ordinary electrons, but I've experienced
firsthand how "reliable" flatcable can be. NO THANKS!

And with a few glasfibres, the link would (and should) still be flexible.

I think we're arguing the same side of the issue...

I agree with you that Atari probably bought the sole rights to produce home versions, but I don't think Williams was on thin ice with the emulator. Buying rights for home versions usually means being allowed to write new code for the home system, and even though the new code may differ in form and function, they can still use the official game name. WAC used the original code of the games, and the only new code written was for the emulator; hence, you're talking about a new "OS," not a new version. Yes, it's something of a "back door," but you have to remember that in the US, the copyright is held by the original writer, or the comany that hired the writer. Therefore, since Atari was licensing their version, Williams was fully within their right to release their own home version. Maybe you're right that the British system is different. Unfortunately, it's these differences that keep us questioning things like this :-(

The end result is, of course, that Hasbro SHOULD be able to create new home versions for all of the titles mentioned, which is good for all of us. Hopefully, when today's youngsters start playing new versions of these classic games, they'll realize that great graphics and great sound don't necessarily make a great GAME -- something us 8-bitters have known for a very long time!

3383. For Trade: Atari ST ext. Hard Drive

3384. Audio out? (Thrift store gold)

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-30 00:00:00 UTC
From: Linda Shippert <loo@u.washington.edu>
Message-ID: <Pine.OSF.3.96.980330093128.15782A-100000@becker2.u.washington.edu>
Source record: 64195

Yesterday at the local Goodwill, I found a Magnavox composite monitor for $25. I'd been thinking about benching the old TV but $25 for something that I had no idea if it worked or not seemed a bit steep. I finally decided to take the risk. What I didn't know was that it was "green-tagged" and all green tagged items were on sale for 99 cents! 99 cents for a monitor! SWEET!

However, all that glitters is not gold. I hooked it up to my 800xl and it worked fine, the first time. Ever since the first time the monitor has no sound. Cracking open the case I can see that the speaker looks fine but the solder connections for the audio plug look broken. I'm guessing that plugging and unplugging the cable was enought to break it. It looks like I might be able to re-solder the connection, but I'm curious about alternatives.

I see from the FAQ that pin 3 on the 5-pin din plug is "audio out". What do I need to do to hook that up to a pair of external speakers? Do I need to amplify the signal or can I just run a wire from pin 3 to a speaker?

Thanks!

Time to clean out some of the 8-bit stuff to make room for some 'new toys':

Atari 130XE Computer System $25.00
Sanyo DMC-5500 Composite Video Monitor w/video cable $35.00
Atari 800 Computer $15.00
Atari CX85 Numeric Keypad $ 5.00
Atari Light Pen w/Atarigraphics $ 5.00
Atari 1020 Color Pen Plotter $10.00

The Monkey Wrench II $ 3.00
The "Pill" (allows backing up cartridges to disk) $2.00
Qix (game cartridge) $ 2.00
Centipede (game cartridge) $ 2.00
Defender (game cartridge) $ 2.00
AtariWriter (cartridge) $ 5.00

That'll do it for now -- I'll try to dig out list some more things when I
get around to it (probably when I get something new and need more
desk/shelf space ;-).

3388. Web page fading away....

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-30 00:00:00 UTC
From: rfunk@peri.acs.ohio-state.edu
Message-ID: <slrn6i00bo.n0j.rfunk@nyssa.acs.ohio-state.edu>
Source record: 64199

As many of you may have noticed already, I have not been maintaining my Atari web page (or any of the others) in quite a while. For a long time I have mostly ignored requests to update or add information or links. These days I spend all day in front of a computer at work, and have very little desire to do computer work in my spare time (and when I do, it tends to be more fruitful to hack Linux than the Ataris).

So I plan to take down the Atari page in a few months, probably in June (after I finally graduate). So I suggest that somebody grab anything of interest and put it up somewhere else (I may be able to help with a transfer).
http://er4www.eng.ohio-state.edu/~funkr/Atari/

Also, if you're anywhere near Columbus, OH, let me know if you might be interested in some cheap (more likely free) hardware (a couple 800XLs, a 400, maybe a 1050, maybe other odds and ends). My apartment is too small to keep so much stuff I never use, and it's time for me to admit that I'm not going to use it. (I'll hang on to a 1200xl and a 1050 though.)

Anthony,
For the money that you would have to spend to do such a feat, you would be better off going out and just buying a XF 551 drive that can already do just what you are asking. But than again these are just my thoughts..... Have a great Atari Day!

Best to get a Y-connector and hook it up to a stereo. A boom box with
an external input will work as well or better than typical powered
"computer speakers" for about the same price.

3395. 8bit + (APE+TCPIP)=Internet capable atari?

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-30 00:00:00 UTC
From: *rlcolli*@ibm.net
Message-ID: <qnFI1kimRZ9c092yn@ibm.net>
Source record: 64206

Here's an idea I had:
Using APE and TCP/IP on an IBM, put the 8-bit on the internet. If nothing else, have the R: device emulate telnet. You boot up Bobterm on the 8-bit, set it to use APE as the r: device, put the IP or name address to dial, and your Atari is on the Internet!! Is this feasable?

It should then be possible to create modem games for the 8-bit that work over the internet. The programming would be the same as a modem game, and the IBM would handle the TCP/IP junk.

Until I got on the internet I haven't known anyone else with an Atari computer. I've messed around with the joysticks before and it looked to me like one pin was +5V and you just hook it to one of the other pins for left/right or whatever. How can the atari send data out through the joystick ports and how could you do it in BASIC?

>NOOOOOOOOOOOOOOOOOOOOOOOOOOO!!!!!!!!!!

That's the word anyway.... sheesh what a shame. All the designs for
the custom Atari ICs went to the bit bucket. Nothing like reformiting
mass storage without at least backing up those designs to tape or
something. What a waste. Without those designs, it is HIGHLY
unlikely that anyone would take the time or make the effort to
reinvent ot reverse engineer those chips. Besides that, not just any
Tom, Dick, or Hairy is even capable of that type of project or has
access to the sophisticated equipment needed to accomplish such tasks.

In other words, when it comes to those CUSTOM Atari ICs, I think we're
all sadly up the creek. :(

Message-ID: <6fsee6$519@sjx-ixn9.ix.netcom.com>
Source record: 64041

With the recent version 0.9.0 build of David Firth's Atari 8bit emulator, I have decided to undertake the task of re-verifying the compatibility of the mass of binaries and bootdisks available in Yogi's archive. This posting includes my findings for those binaries located in the A-I directory. Hopefully I will be able to get on to the remainder soon.

One note that I can make straight off the bat is that David Firth's emulator, due to its ongoing development, now seems to offer better overall emulation than XL-it! by Markus Gietzen, in terms of compatibility (i.e. greater number of programs supported), colours, scrolling, and collision detection. However, I still encountered a number of binaries for which XL-it! behaves the better of the two.

In testing, I first converted each binary to atr format using Ken Sider's MAKEATR utility. I started each test emulating the 130XE model, working my way through 800XL, and finally to 800 emulation if the program refused to boot. For the record, I am using the MS-DOS versions of both emulators, running under Win95.

The following list contains those binaries which best worked, or would only work, under the old Atari 800 emulation.

AstroGrover
ATLANTIS
Blackhawks
Checkers2
CIMEXREX
COMBAT
DancingFeets
DARKSTAR
DemonAttack
DesignersPencil
DigDug5200
DreadnaughtFactor
DucksAhoy
Fastgammon
FinalFlight
GalacticAvenger
GhostEncounters
GhostHunter
IncredibleLaboratory

This next list contains those binaries which did not appear to work correctly with either emulator, using any configuration. When examining the integrity of these files using Sidney Cadot's BIN utility, I found that most of them were corrupt in some way. If anybody has any new, working versions

of the binaries then please either email them to me, or upload them to
Yogi's archive. Also, any updates or revisions to the list would be greatly
appreciated.

Airstrike
ALLEYCAT
AMAZED
ANDROID
ANTEATER
AstroDroid
ASTRONIX
AxisAssassin
BallisticInterceptor
Billiards
Blackjack
BountyBobStrikesBack (loads up fine with David Firth's emulator, but does
not respond to directional controls)
BURGERS
BurtsBrewBiz (I know this works fine in the megaimage available on the net)
CandyFactory
Cannibals
CaptainStickysGold
CaptureTheFlagSirius
CaptureTheFlagSirius2
CarnivalMassacre
CASINO
CastleAttack
CHICKEN
CHIMERA
CHISELER
ChoensTower
ColossalCave
CopterChase
CrisisMountain
CrosswordMagic
CrystalRaider
DARTS
DavidsMidnightMagic
DEIMOS
DespatchRider
DestinationUnknown
DontShootThatWord
DoomWorld
DROGAWOJ
ElectricianTitle
Elektraglide (the bootdisk version does work, though)
Eliminator
EUREKA
FortApocalypse_DV
FrogsandFlies

GalaxyDefender
Ghostbusters (the bootdisk version works)
GhostbustersVoice
Gladiator
HardHatMack
HenrysHouse (again, this works in the megaimage)
SRALA

I know where one Antic program can be found, anyway. I know I have a copy of the August 89 Feature Application, Customer List Manager, around here someplace. I even have a copy of the text of the article, as it was originally submitted, not the edited version that was published. I did sign a contract selling all rights to Antic Publishing "in perpetuity". I have a copy of that around here somewhere, too.

However, it's been some time since I thought that contract had any teeth left. If someone has a need for this information, let me know and I'll see what I can do.

When I left Genie they had an excellent collection of Antic and Compute! disks in their Atari8 library, along with a very good collection of Analog disks. Though a mere shadow of its former glory, Genie is still in operation. That might be a good place to look.

3410. Sio port

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-31 00:00:00 UTC
From: probb26666@aol.com
Message-ID: <1998033101234001.UAA21080@ladder03.news.aol.com>
Source record: 64208

Okay, here I am again. Due to my vast lack of knowledge about newsgroups, I have no idea why my message from yesterday is now gone.

Anyhow, the thing I am building does have wheels and is motorized. That's why I said "lumbering wood platform" (pun not originally intended). The H-bridge motor driver plugs into one of the joystick ports. The arm has three motors so I need six outputs to control all of the motors.

I want to use the clock out, serial data out, clock in, and serial data in pins on the sio port to communicate with the arm. I don't think I need any kind of printer or rs232 interface, I don't how it would work with tha arm and I don't want one because there is limited space. I believe I can use an 68hc11 microcontroller, which has built in serial ports, to communicate with the computer, but I don't know what communication protocols are used. I expect that words like "handshaking" and the like will come up.

Please respond via e-mail as well.

Thanks,

Patrick Robbins

With reagrds to Atari buying the rights to games like Defender, let's not forget that there's really no such thing as a business contract "for perpetuity". Atari may have bought those rights, but my guess is that it was for a specific period of time. In many cases, an option has an escape clause that if the licensee does not use the license in X time the rights lapse.

Antic sold a disk edition subscription, with the featured programs, and
a few bonus programs. I've got several years of them, but due to being
unsure of the copyright status, I can not share them.

I think on the Atari 8-bit computer version you hit the "T" key to set
the game to use the Trackball in trackball mode. Of course you need
to then set your trackball to trackball mode not joystick mode.

>it?

Actually, location 54016 controls ports a& B(stick 0& 1). By connecting the sticks to port a, in parallel, and using port b to select which gnd is active, you could actually have 16 sticks online at one time(multiplexing). But, most commercial games could never be hacked to patch it to read the stick ports this way. It would be a lot easier to use a 400 or 800 for four players. Thats what I do for Dandy Dungeon(written by John Palevich, sold through Antic). I have a version that loads the levels into a ramdisk if available on any 400/800 /XL/XE with at least 64K. And I have another version with new levels.

>CU Mathy Van Nisselroy

Why not make a copper wired cable, just not a FLAT one? Make
connectors on one end of it for your computer, the other end with a
connector for the BB. The main part of the cable would be multi
conductor, well sheilded cable of a suitable gauge to handle the
length you need to make it. Such sheilded cable is much more reliable
than flat and may be reliable enough. Trying to go a fiber optic rout
to me is like trying to get an 8-bit Atari set up in your car as the
computer controler for running the engine, instead of using the one
that comes with the car. It just seems waaaayyy too hard for too
little advantage. Just my opinion.

3420. Re: XEGS Missile Command in analog trackball mode? - Works

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-31 00:00:00 UTC
From: Stephen Knox <gooch@erols.comX>
Message-ID: <3520DE5D.4900BA9E@erols.comX>
Source record: 64218

I just plugged my Trackball into my XEGS and it worked fine. You need to press CTRL+T (The screen should refresh itself really quickly). Make sure you set the switch on the back of the trackball to TB and off you go.

Mathy,
You're right. I did misunderstand your request. This one's a bit beyond
me, but I'd think that it should be able to be done. I suppose it would
take a frequency or time division mux/demux to FO at both ends for full
bi-directional communications for all those signals. I understand the
theory, but to design such a beast... well... uh...
Sounds like an interesting project. Something like this could also be
used with the MI/O.

Jon,
Why NOT? This is an Atari 8-bit... Experimenter's dream! I'd like to
see someone take this on, just to prove that it can be done.

3423. Extended SIO floppy commands?

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-31 00:00:00 UTC
From: thor@math.tu-berlin.de
Message-ID: <thor.891348674@math.tu-berlin.de>
Source record: 64221

Hi folks!

Does anybody have a list of non-standard SIO floppy commands and their usage for "enhanced" 1050s or the XF drive? I'm planning to add these to the atari emulator (Davids emulator, 0.9.3) and need some background information for that job.

The current emulation includes the following set:

W write with verify
P write w/o verify
R read block
S status
! format single density
" format enhanced density

and, still a bit beta:

N,O "815" configuration block read/write

but, looking at the command the spartados sends, this list is uncomplete.

And, probably another topic of interest: The plain 1050, too, responds to more commands than just the first set above. I tried all commands from 0 to 255 and found some additional seeking or head control commands, even another format command seems to be present. Does anybody have an idea what these are used for?

So long,
Thomas

Patrick,
Actually, you might be better off with the joystick ports. There is
more control for them. besides, there is more documentation for device
control for the JS ports. Using these pins you can have full
bi-directional communications with very little interfacing.
Does this arm require RS232 or can you just connect/control these
motors directly?
There is a very excellent book on interfacing projects with the Atari
8-bit called "Your Atari Comes Alive" by Richard Leinecker and David
Burd. It is available from B&C Computervisions www.myatari.com . This
book will describe everything you should need to interface your 8-bit to
this device. You might also want to get a copy of "Mapping the Atari" by
Ian Chadwick. This too should be available from B&C.

There's a site in www.atarimagazines.com that has all the disks for
Antic mag, in zip format or individual programs, Analog, is in the same
site, you just got to find it, is arc compressed.

Kevin Savetz is spearheading a project to archive all issues of Antic as
HTML files. He has received permission from the former publisher of Antic
for this effort, so everything's aboveboard. Many of the type-in programs
found in Antic are available at the Web site, www.atarimagazines.com.

I'm not sure if he's attempting to get permission from LFP (or whoever holds
the Analog copyright) to do the same with Analog. Kevin, are you out there?

I'd also be interested in this info for inclusion in my ramdisk program. You've listed above all the ones I know about (and that my ramdisk currently supports), but if there are any others then I'd sure like to know about them. I also added 3 new commands that my ramdisk recognises (A,B and C, IIRC) which are specific to it and you wouldn't be interested in for the emulator, but if they clash with anything else then I'd be interested in knowing.

Out of interest, do you have a list of the other commands recognised by the plain 1050?

If they use the shadowed copy of the stick values, you could just hack
the OS to set them up appropriately for 4 joysticks. For that, I
would lean towards using a resistor/POT hack to send the signals for
the extra pair of joysticks through the paddle inputs.

>be interested in for the emulator, but if they clash with anything
>else then I'd be interested in knowing.

>Out of interest, do you have a list of the other commands recognised
>by the plain 1050?

Unfortunately, no. This "experiment" is certain years ago, and I don't remember
the details, I didn't wrote them down. All I can say is that none of these
commands have been used by any dos ever, and for most commands I've had no idea
what they did. Some of them seemed to re-position the drive head, others
sounded like "format commands", but left the disk in an unusable state, neither
ED nor SD. Probably some hidden partial "DD" support? No, actually, I've no
idea, really.

As for your RAM drive: I guess it's O.K. to take the risk and use these
undocumented commands, as I know not a single program that makes any use of

these.

So long,
Thomas

3443. Re: joysticks 2-way?

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-01 00:00:00 UTC
From: thor@math.tu-berlin.de
Message-ID: <thor.891421819@math.tu-berlin.de>
Source record: 64054

Howdy!

teej213360@aol.com (Teej213360) writes:

>Until I got on the internet I haven't known anyone else with an Atari computer.
>I've messed around with the joysticks before and it looked to me like one pin
>was +5V and you just hook it to one of the other pins for left/right or
>whatever. How can the atari send data out through the joystick ports and how
>could you do it in BASIC?

That needs a lot of peeks & pokes and reprogramming the PIA chip which serves
the joysticks (and the "MMU" for the XL/XE series).

You need the following addresses:

$d300: PIA port A I/O or data direction register.
Port A is connected to the joysticks 0 and 1, the lower nibble for
joystick 0, the upper nibble for #1. I don't remember the assignment
of bits to the directions, but that should be easy to find out.

The function of this address depends on:
Whether the bit 2 of the PACTRL ($d302) register is set or not.
If set, this addresses the I/O port: Reading this register gives
the states on the joystick pins, writing them sets the PIA-A
output buffer. Wether the buffer state appears on the pins or
not depends on the data direction register, i.e. whether these pins
are programmed as input or output.

If bit 2 of PACTRL is cleared, this address addresses the port a
data direction register. One bit in this register corresponds to
one bit in the PORTA register. If the corresponding bit in the
DDR is cleared, the bit of PORTA is an input, if set, it's an output.

$d301: PIA port B, or PIA port B DDR, depending on bit 2 of the PBCTRL.
Better don't touch this, because it's used for the MMU control of
the XL/XEs.

$d302: PIA port A control register. Only thing you need to know is the bit
#2. If set, $d300 is the Port A I/O register. If cleared, $d300 is
the port A ddr.

$d303: PIA port B control register. Don't touch.

Hope everything is right here, I wrote that from my memory...

Thus, to program the PIA pins as outputs:

o) Remove all joysticks to avoid shortcuts (-;

o) Clear bit 2 of $d302.

o) poke $ff into $d300

o) Set bit 2 of $d302.

o) Write desired bit pattern into $d300.

o) Done.

As I said, I hope I remembered all bits and addresses correctly, it's been
a while...

So long,
Thomas

3444. Auction: Less Than 1 Week Left - Atari 8-Bit Magazines/Items

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-01 00:00:00 UTC
From: clauction@aol.com
Message-ID: <1998040112295201.HAA15889@ladder01.news.aol.com>
Source record: 64055

April Auction - Update 7

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, April 6 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

Brett,
This means unknown device. Is your program looking for some device that
would normally be attached to a real 8-bit system that isn't mounted for
the emulator?

Actually I have got a get out clause even if they do clash with
something else, as it is possible to redefine the ramdisk specific
SIO commands from the the configuration file (along with a lot of
other things). But that causes another set of problems, since
anything written to make use of these Ramdrive commands wouldn't work
if they get changed to something else. Still as far as I know there
aren't any programs that use the Ramdrive SIO commands.

Thanks,

Does anyone have info explaining the graphics
format of Atari 8-bit pics saved in the compressed
koala format? Or, even better, would be C code
to convert the data to a PC graphics format.

I have some old pics which my brother and I drew
which I'd like to convert into GIFs.

Thanks.

Mario

Is there such a program available as an Atari 8-bit emulator for the PC?
If so, where can one find it and are there games available to run on it?

I just tried the Sinclair ZX81 emulator and it is great! The Atari was my
second, third and fourth computer! It would be fun to see it again.

If memory serves me correct, error 130 is device non-existant. Usually,
you get that if you try to access a device that *guess what* doesn't
exist! Such as printing to P: when you don't have a printer.

But since you are getting it in an emulator, that is a little trickier. I
would say that large basic file may be corrupted. Have you tried Xlit
0.20?

actually, I was fooling around last year and did manage to mechanically
mount a TEAC 360K drive in a 1050 case. It just needs a little trimming.
Sticks out just a tad, but looks OK, really.

if you use a new, new 360K TEAC, the current drain won't be too bad.
other change needed would be to replace the 2793 controller with a 2797
chip, which supports a DS drive.

oh, and a lot of programming......

I'll do the hardware if you do the software!!

Bob

: trying to load a large (257 sector) basic file on every emulator I've tried.

Error 130 is Nonexistend Device. Are you specifying a drive to load from?
(Example: LOAD "Dn:FILENAME.EXT" [RETURN] where n=drive number 1 to 4.
Drive 1 is the default and doesn't have to be specified (D: and D1: are
the same thing). If you're trying to load from D2 through D4 you might
have to configure your DOS for the highest number of drives you're using.

Source record: 64069

I have acquired an 800xl and 1050 drive and a printer too.

Problem is - no disks with the DOS

How do I get a copy of dos. I have done much looking on the net and found refernces to anadisk. Can it for mat a 1050 disk and dump the DOS onto it.

If so can anybody help - how do i do it and where do i get the DOS on the Net.

Or maybe somewould be able to mail me a disk with DOS - I would pay for mailing costs and cost of disk quite happily.

Thanks

Trevor Hughes

What exactly is my screwups ? It works fine under DOS. So what the f**k is my screwup ? Let me know and I'll correct it and stand corrected. But it's still 95's fault. It's unstable and not very good.

It's about time I chimed in here, since I wrote the original message that started this.

When I run SIO2PC or A.P.E., it's from DOS 6.22 on the PC. Win '95 never enters the picture. I have both on the PC, but I run the DOS 6.22 from a hidden C: bootup partition that I can switch to upon restart. So, you guys can argue all you want about Windows '95 and it doesn't help me at all.

I've tried just about everything short of replacing my SIO2PC interface and/or serial cable. I've connected my Atari floppy directly to the computer, bypassing the Quintopus. I've changed with the settings in A.P.E. one by one. The problem occurs when A.P.E. is running and not when the SIO2PC software is running and as far as I know nobody else has the problem of data overrunning the Atari floppy drive during a write.

Not to start a strain of messages on Windows 95, but I wanted to add my opinion here. Windows 95 works great until you load software into it. If you format a system and put Win95 on it and don't load other software, and don't go on the Net, you could play Solitaire until doomsday and it would be quite stable. The problem with Windows 95 is, to make it compatible with old DOS programs and old Windows 3.x programs, it has to "let it all hang out" with its options, controls, and vulnerabilities. Software programs come along and conflict with 95, conflict with each other, conflict with your hardware, etc. 95 is the easy target to blame because it is touted as easy to use. If anyone chooses to reply to this, that's fine; I won't re-reply. My opinion stands in this message. Thanks for reading it.

I was once a subscriber to Antic and don't have any of the mags anymore, but they had a special subscription that came with a support diskette - with typed in programs, source code, games, etc. They packed both sides of the diskette with nice stuff. I have a few (not wanting to part with though) - you might seek some of them out. Does anyone out there have some that they don't want anymore?

Perry Powder <microtac@sprint.ca> wrote in article
<3521DDA0.23641BDA@sprint.ca>...
Remember these magazines? Remember the programs they included for
you to type out? Does anyone know of where you can get these (already
typed)? Also does
anyone know what happened to all the cool programs people must of sent
into these mags for possible publication? The editors must have kept an
archive somewhere.

3463. Re: lots of Atari 8 bit stuff.

Also, the next time you go to your library, there is (or should be) a posting indicating that copying material from a book at a library is OK if it is done for research. So if you reproduce a book's material for profit, that's still illegal; but you can copy for free for research and that is legal.

Further, I have called the Software Publishing Alliance (or whatever
they're called) and asked them. Their legal advice? Copyrights for
software are good for 70 years and only expire if they are not renewed.

Not sure who started the SPA but I know Microsoft has their hand in it. Perhaps it would make more sense to people reading my message if I indicated that, because of religious beliefs, I have to obey laws. There was a time that I did not, and I'm trying to make sure that either 1) my Atari stuff is legal now, or 2) that I make it legal, or 3) get rid of it. The easiest way I can figure to make a pirated program legal is to buy a legit copy of it (even if it doesn't work) and then the pirated copy is just a backup and therefore legal. Yep, I'm looking for everyone's 2 cents (or $1.50) on this. Thanks!

I have seen Atari DOS version 2.6, and the main screen says "Made for the Atari 800" (or something like that.) Has anyone else ever seen this, and can anyone tell me about it? I'd like to try to hunt down an original disk if possible (even if it doesn't work).

I used DOS 2.6 for quite a while. It's a modified version of DOS
2.0 and was never an official Atari product.

I recently got an Eprom burner from an Abbuc Exec member.....thanks Joost!

Anyhow, I have been having some trouble with the burner giving me an
"Error 82" when trying to read the Eprom. I was wondering if anyone here
has an Atari 8 bit Eprom Burner from Germany produced by a guy named
"David Ralf"? (Off the top of my head, I may have to the name wrong)
And, if so, do you know what "Error 82" is?

Willy

Ken and "Vidar":

Anyone can make up stories as to why things don't work. It's easy to just blame the OS when you don't know what your doing. I'm not saying Win95 is fabulous. I'm not even saying it's great. But I use it all day, at work, at home and NEVER have the kind of problems you are claiming to have. Further, where the heck did you get the completely baseless story about 3/4 of all shipments being sent back?

>do not worry, it IS NOT your fault! you are quite correct in your
>assumtion that win95 is at fault. how could it be anything else when
>3/4 of win95 packages bought were returned because it didn't work.

3478. 5200 Power Supply Question

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-02 00:00:00 UTC
From: Chris <room101@nospam.com>
Message-ID: <6g1lmfnrg1@winter.news.erols.com>
Source record: 64089

Hi there.

Picked up an old 4 port 5200 with no controllers or power supply. From what I've been able to deduce, having disassembled the unit, it accepts power through the video out cable, reminiscent of remote powered TV amplifiers. I found a source that claims 11.5VDC at 1.95A. Okay, that is doable, but what polarity and how should I interface it with the video cable? As I don't have the fancy RF switchbox, should I instead add a jack to the 5200 and isolate the video out from the power supply? I think that's the better (safer) route. Let me know if you've done this.

Chris

Robert wrote:
>Does this arm require RS232 or can you just connect/control these
>motors directly?

Did you actually read all of PRobb26666's message?
He says "I believe I can use an 68hc11 microcontroller, which has built in
serial ports, to communicate with" ...Doh!

There was a series of articles in Antic circa 1985, on hooking up the
armatron. It involved using stepper motors (I think) and nylon wire hooked up
to the miniature controls. But it was in no-way an electrical
arm. Only mechanical, plastic gears and one very noisy mechanism.

Using the joystick ports is the easy option. But Patrick won't say how
the arm will be controlled from the serial chip.
Six outputs? Don't you mean 3 control plus 3(tied) 0 volt. 4 wires
Basically we're groping in the dark.

Serial Output Data (8 bits) @ $D20D is transferred to the serial shift
register, when a full byte of serial data 'has been' transmitted.
Usually written in response to a serial data out IRQ and Bit 4
of IRQST @ $D20E is 1
Pokey timers (audio channels) have to be setup in the correct sequence,
otherwise it can cause a spurious interrupt and lock the system.
Put simply,
Get the Hardware Reference Manual. :-)

No 5200's either, although it was a close call. The 5200 appeared in several
mail order catalogues but Atari UK had cold feet at the last moment. Boy,
were
they dumb!

1200XL never looked like being released over here, though.

Do you use many DOS applications then ? That's where the troubles arrives mostly. But even so, Win95 was released with over 30000 bugs I believe. That sure must make some problems. Atari DOS was reliable, I love it. Atari Forever

I am currently a sys admin of a network with a couple of NT machines, a few Solaris machines, a gaggle of Linux boxes, and 50-or-so pc's with Win95. Win95 is unstable, buggy, error-prone, unpredictable, and generally not worth much. To be fair, once a machine is fully configured and working OK, it generally does just fine. But Christ, if you have to constantly add and upgrade software and hardware (like I do on my personal machine), get used to re-formatting every couple of months as a matter of routine. Keep in mind that this is coming from a person with a background in Unix and VMS, where I have had systems that weren't rebooted for months at a stretch (longest running machine was up for 490 days, only taken down to move locations!) who is now using a Win95 machine that has to be rebooted several times a day. As for making up stories as to why things don't work, I prefer the real stories I have from my job. Like my favourite lines from late-night emergencies with MS tech support:

1) You're not gonna like this, but you have to format and reinstall....
2) We recommend rebooting every couple of hours to maintain stability....
3) Well, you really shouldn't use Windows 95 for something so important. Can't your program run under NT?

3487. Re: SIO2PC yippees

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-03 00:00:00 UTC
From: Alan Sharkis <asharkis@erols.com>
Message-ID: <01bd5f02$d1286260$49dcaccf@asharkis.erols.com>
Source record: 64098

Hey, guys, I posted the original message that started this thread some weeks ago, and I posted a reply to your message yesterday, but it never got into the ng.

When I run SIO2PC or A.P.E., I do it from a clean boot from a hidden C:\ partition that contains nothing but MS-DOS 6.22. I can switch to this partition when I boot-up the PC. Windows 95 never enters the picture as far as SIO2PC and A.P.E. are concerned. The problem is at the Atari end or in the A.P.E. software, so you can stop all your squabbling about Windows 95 on my behalf :-)

(I'll reserve my comments about Windows 95 for a different thread when I have _NOTHING_ else to do.)

Here's what I've done to date:

1. I've eliminated the Quintopus by hooking everything in a daisy chain.

2. I've put the Atari 130XE with the 320K and US OS+ added by Puff into 800 mode.

3. I've switched computers to a stock 800XL.

4. I've put A. P. E. into stupid mode at 1X.

5. I've changed every setting in A. P. E. one-at-a-time.

Here's what I haven't done:

1. I haven't changed the serial cable between the PC and the Atari.

2. I haven't tried a different SIO2PC Interface, because I have no access to a different one.
Remeber -- the one I'm using was an original, Nick Kennedy-constructed two-chip model without the added diode.

The write to the 1050 or XF-551 continues to fail some 10-20 sectors in when I try to copy from an .ATR to a physical Atari drive. It sounds like the data is just overrunning the drive.

Yeah, I forgot about that. The PC CD had a whole multimedia thing about the history of the games, and it talked about how the Williams guys about hit the floor when they saw the emu created by Digital Eclipse Software, Inc.

BTW, Bill: The PC version of Sinistar has a setting that will turn the game sideways on-screen, so if you can turn your monitor on its end, the game has the same perspective as the original arcade monitor. Can the PlayStation do that?

Steven

>-bill!

You got it, Bill!

Ok, now that this issue has started, I'm going to use Bill's software
as an example. For those of you who are new, if you don't know Bill
Kendrick, go to http://zippy.sonoma.edu/kendrick/nbs/atari/ and then
come back here once you've played all of his games to death.

Bill wrote a game called GemDrop, that most of us have played by now.
Let's face it -- compared to the graphic content of most of today's PC
and Mac games, GemDrop is not very striking to the average gamer. But
there are no average gamers in comp.sys.atari.8bit, and we all know
what a graphic achievement GemDrop really is for the Atari. Bill did
an excellent job in sqeezing out as much graphic quality as he could
in this game, but the real strength of this game is that it's
incredibly fun! People are constantly talking about what a great game
it is, and how they've spent hours and hours just trying to get past
level 10 (BTW: I hit level 16 a few weeks ago, and had to put it down
for a while until the carpal tunnel got better ;-). Thanks, Bill!).

Planetary Defense, an Analog Magazine game, is another example. No
fancy graphics here, just hours of bomb blasting until your trigger
finger falls off. And this was a game you TYPE IN from a magazine!

Atari programmers knew then, as well as now, that graphics weren't
everything. If the game wasn't any FUN, nobody was going to want to
play it for very long. Look at Star Raiders. The guy that designed
the POKEY chip created SR as one of the 1st (or was it THE 1st?)
400/800 games. SR sold like crazy, and it was only an 8k cart!

>: Are you implying, with your bare face hanging out, that classic 8-bit
>: games don't have great graphics and sound? :)

Not at all. They have unbelievable graphics and sound -- for a circa 1980 machine. The point is that today's games tend to spend too much time on pretty pictures, and not enough time on great gameplay. And when I talk about "today's" games, I mean PC & Mac and 32-bit & 64-bit platform games, not games written today for yesterday's systems. My gripe is with the companies who have modern computing systems and then waste their capability with stupid games.

Epic Megagames, Origin, Id, Sierra and a few others are exceptional, so please don't point out a specific game that is also exceptional. I know there are some good games out there. My point is that there should be MORE.

Steven

3490. APEX - (Atari Program Exchange)

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-03 00:00:00 UTC
From: stevenposey@usa.net
Message-ID: <352500d3.81234340@news.ioa.com>
Source record: 64101

What's the official word on what happened to APEX? I've seen a few of the progs on the net, but does anyone have an official archive of all of APEX's software, or did the original writers retain all rights for themselves once APEX dissolved?

Steven

3491. Re: Old Antic and Anolog programs.

They're out there. Go to http://sunsite.unc.edu/kevina/atari/mag/ and
you can get both Antic and Analog disk images. The only downside is
that Analog didn't include the files on disk option until July of
1985, so none of the earlier great games, like Planetary Defense,
Adventure in the 5th Dimension, Fill-er-Up!, etc. are on that site.
The UMich archive may have some of the earlier ones, and I know I've
seen them floating around some of the so-called pirate archives. We
have to rely on those brave souls who actually TYPED IN those games to
make them available on the net.

Good luck,
Steven

April Auction - Update 8

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, April 6 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current
mailto:mcurrent@carleton.edu
http://www.faqs.org/faqs/atari-8-bit/faq/

Atari 8-Bit Computers: Vendors and Developers / Michael Current

I have no need to make up stories for an os that really does NOT work.
and i work with computers all day every day. Just call merisel and
tech data and ask them about win 95 return statistics when it was
released.
this is also my last post on this subject here, it is after all an
atari8 news group and NOT winshit95.

Re: WIndblote '95
Microsoft products seem to work fine don't they? It's Microsoft's
global domination tactics at work here. They undermine a competitiors
product(s) by making it crash 'more often' than their
own equivalent product(s). The Java incident is a recent issue,
where microsoft altered the java specification so as to render it
unusable on platforms not running on microsoft products.
BTW, Sun microsystems won the battle. (Pie in the face for Bill G.)

WazzdOrf

3497. ST Informer Magazine returning to the web

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-03 00:00:00 UTC
From: stirrell@portland.com
Message-ID: <stirrell-0304981434180001@portland15.portland.com>
Source record: 64108
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.ataralt.atari-jaguar.discussioni.programmer,alt.atari.2600,rec.games.video.atari

First of all, please excuse me for cross-posting this but I thought it concerned all Atari owners. ST Informer Magazine is set to return soon in Web format. Many previous subscribers probably know that ST Informer's web site has been stagnant for awhile. Well, I have just been appointed Web Editor of ST Informer and hope to change all of that with monthly issues of ST Informer. Issue 98 will be posted shortly. For those who want to be kept updated, please send me an e-mail and I will add you to the ST Informer mailing list.

What will ST Informer include? I plan on having letters, Rod's trademark Potpourri column, news, interviews, and product reviews. What Atari products will we cover? All of 'em with a focus on the computer line. This will include pictures (though they will not be bandwidth-busting). There will be no Java or animated GIFs so that we can concentrate on the information and to make this site available to all (even those with slower modems like myself).

This, of course, cannot be a one person show. First of all, I don't own all Atari systems. Secondly, I just don't have the time to write all of the articles, lay out the pages, etc. I am asking for volunteers interested in writing for the magazine. The benefits include, er, fame and, um, prestige. Seriously, it is fun and those willing to put in the time will be first considered for review products from vendors. All submissions are welcome so please send your articles to me at stirrell@portland.com.

For advertising information, please send requests to Rod McDonald at stinformer@chatlink.com. He will be happy to send out information. Also, to get your products reviewed, please contact me atstirrell@portland.com. I will make sure that they get to a reviewer as soon as possible.

If you have any comments or suggestions for ST Informer Magazine, don't hesitate to write to me. I really want to hear from you and, as a community, make this new venture a success for all Atarians.

Sincerely,
Scott Tirrell

>
> Steven
>

Sorry it's APX not APEX, i have an ad from B&C from a little long ago
that lists about 100, titles of the APX, there are titles like
Insomnia, Eastern Front 1941 and lots of others, i think APX close in 1984
and Antic bought some of the tiltes to sell them as Antic Software, i
remember Xtal, Weakon, Deep blue C and other tiltes, not much to be true, and
as long as i can see much of those titles are lost forever, i haven't seen
much in the net, maybe 20% maybe less. Let's see, if someone is interested
i can post a partial list of the titles of APX i know.....

Javier.

Incidentally, the Playstation version is unplayably awful-looking put
through an RF modulator setup. I would assume using a composite,
s-video, or RGB hookup is much better, though.

Brent

wrote:

-
-They're out there. Go to http://sunsite.unc.edu/kevina/atari/mag/
and
-you can get both Antic and Analog disk images. The only downside is
-that Analog didn't include the files on disk option until July of
-1985, so none of the earlier great games, like Planetary Defense,
-Adventure in the 5th Dimension, Fill-er-Up!, etc. are on that site.
-The UMich archive may have some of the earlier ones, and I know I've
-seen them floating around some of the so-called pirate archives. We
-have to rely on those brave souls who actually TYPED IN those games
to
-make them available on the net.
-

Actually, this is a bit of a quandry - according to the articles
themselves in the Analog mag, they call the games "Public Domain" and
yet they are (c)... leads me to believe that theres no harm in putting
them out on the net. So.... which is it? (I consider most of those
analog games better than some commercial games....)
Especially fill er up

>box or another monitor.

Unless your monochrome SVGA monitor is actually a rare monochrome
multisync (i.e., NEC Multisync GS), you are out of luck for an
inexpensive connection. The biggest stumbling block is that an
standard SVGA monitor cannot handle horizontal sync rates much below
standard VGA's 31.5Khz, and the Atari uses 15.75Khz.

If your monitor was a Multisync GS, then it would be possible to make
up a relatively inexpensive circuit to take the luma signal, strip out
the H&V syncs that such a monitor would need, and feed the pure luma
signal into the mono input on the monitor.

Without the capability to handle a 15.75Khz H-sync signal, the only
way to connect an Atari 8-bit monitor to your SVGA monitor would be a
device like Instant TV, which would not only be more expensive than a
good used composite color monitor, but would be overkill for use on a
monochrome SVGA monitor.

AFAIK, the only monochrome VGA/SVGA-capable monitors that could handle
15.75Khz signals were the NEC Multisync GS (and possibly the 2 GS,
although I am not certain about that one), and the Princeton MAX-15,
which you would not be asking about, as it sported a monochrome
composite input anyway. (I have a MAX-15, BTW).

The unamplified signals might be enough to drive a small pair of
unpowered speakers, but even then, the volume would be rather weak,
but possibly adequate if your computing environment is quiet.

I used a pair of unpowered 4W-rated speakers with a PC sound card
(which had NO built-in amp) for a while, and the sound was passable.

Building or buying a small mono amp would give more volume, although
if you are not building your own, you might want to compare the cost
of buying an amp + speaker to buying a pair of ready made powered
speakers intended for a PC, and feeding the single audio out from the
Atari to both channels (both parts of the sleeve on the stereo
mini-plug).

I have the following Atari 8-bit (400/800/XE) cartridges available for Trade only. I would like to trade for other Atari 8-bit carts, but will also consider Commodore 64, VIC-20, TI-99/4a, TRS-80, Colecovison, 2600, etc carts. Please reply with your lists or offers if you have any interest. Thanks! regards, Matthew

All of the memory is on the expansion cards, along with the OS.
The memory boards originally came in nice plastic cases with screw on
metal covers. These were dropped to save cost, so later they were just
the bare boards.

< Who's using Atari 8-bit to read usenet anyway >
Well, I do !
I run a BBS on an Atari 130XE 320Kb, supporting comp.sys.atari.8bit and
alt.atari.jaguar-discussions, and this is the only way for me to read and
write message's in this newsgroup...

My internet-provider doesn't allow me to enjoy usenettting. Just E-mail !

So, no HTML for me, since my BBS doesn't support it.

p.s. the software I'm using is BBS-Professional 5.0b, and is released in
1995, so I'm NOT using OLD software...

Sysop Fox-1

I just purchased a couple of Atari 800 and 800XLs at a garage sale. How can
I get these .atr files over to them?

Help!

Thanks.

3509. ER Atari 2600 and 800 games for trade

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-04 00:00:00 UTC
From: Tempest <reicher6@pilot.msu.edu>
Message-ID: <3525D398.53AD@pilot.msu.edu>
Source record: 64115
Cross-posted to:
alt.atari.2600,alt.atari.2600vcs,alt.atari.2600.vcs,rec.games.video.classic,rec.games.video.atari,comp.sys.atari.8bit

I am looking for the following games to complete my Atari collections (I'm down to the ER's and the UR's) if you have any of these games for trade let me know. I have a trade list at: http://pilot.msu.edu/user/reicher6/atari.htm

Here are the games I'm looking for:

Atari:

Atari Video Cube
SQ: Water World
Crazy Climber
Asterix
Rubiks Cube
Gremlins
Motorodeo
Sentinel
BMX Airmaster

Activision

Checkers
Cosmic Commuter
Rampage

Imagic

Shootin' Gallery
Solar Storm
Laser Gates
Subterranea
Wing War (was this released?)
Cubicolor (hahaha...)

I'm also looking for some of the more interesting 2600 games such as: Mangia, Star Wars: Arcade game (I've determined that its the best home version), Frankensteins Monster, Fire Spinner, Any and All Prototypes!

I'm looking for the following 8-bit games: Crystal Castles, Apple Panic (tape game), Air Ball, Gyruss, Pitfall, any prototypes.

Just about anything on my lists at: http://pilot.msu.edu/user/reicher6/atari.htm is for trade, If your unsure about whether or not I'll trade something, just ask!

-Tempest

3510. Old Atari stuff for sale.

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-04 00:00:00 UTC
From: Mike <stoliknospammc@enter.net>
Message-ID: <01bd5f6f$0e9fbc80$20c8eac7@stolikmc1>
Source record: 64116

Hi all,

I'm cleaning out the attic in preparation for a move.
I've got a lot of old 8-bit stuff that I haven't used in years.
Some of this stuff I know I've got in boxes that I haven't
even been able to reach yet, but it'll be coming to light
soon!

2 130XEs 1 w/130k, 1 w/320k
1 ICD MIO w/256k ram
1 10Meg HD for the above item
1 ICD RTime8 clock cartridge
1 400 slightly defunct from a bad 64k upgrade, but
may be repairable
1 1010 tape drive
? flakey joysticks
1 Atari Keypad device
1 1050 Drive w/doubler
1 T-816 board (put a 16-bit processor in your Atari, actually
belongs to a friend but he hasn't asked for it in 5 years.)
1 Basic Rev.C cartridge
1 Basic XE cartridge w/manual
2 Atariwriter Carts. (one may not work)
1 Action! Cart. (Pascal like prog. Lang.) w/manual
1 Assembler/Editor Cart. w/manual
Many Atari books from Compute books and Atari
1 "Programming the 65816" Book
I may have the Atari Touch Tablet, but only found the
empty box (and manual) so far.
I had boxes of old Antic, Analog, and Compute mags. but
haven't tripped over them so far.

Many other odd things may come to light so if you'd like to
hear about them as this archeological dig continues, send
an e-mail to stolikmc@enter.net.

Thanks for your time,
Mike Stoliker
I'm not looking to buy anything, so don't bother to put me
on any spam lists. I guarantee you won't get any responses
to offers to join your ponzi schemes.

3511. re: update: i am joining the bandwagon of f.s. items

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-04 00:00:00 UTC
From: slycy@geocities.com
Message-ID: <6g4ks7$sj9$1@nnrp1.dejanews.com>
Source record: 64117

I know you guys hate all these forsale updates, so I have tried to space them out a bit...

If you have written me before and I have not responded, I apologize and I will do better to respond in the future.

Here is my latest list:

1050 Disk Drive
Magnavox 80 Column Mono Monitor
Sanyo Color monitor (A/V Inputs)
CGA Monitor ... you never know.
Atari 830 Acoustic Modem
5.25" diskette holders (hard plastic)
Indus-style attache: black case for carrying/storing diskettes.

Compute! 50 Magazine Collection (as a set only):
1982 - mar
83 - feb, sept, nov
84 - apr-aug, oct-dec
85 - jan-apr, jun-oct, dec
86 - jan-dec
87 - jan-aug
88 - jan-apr
89 - apr

I am thinking of selling an 800xl, my 850 interface, and my 800 that is upgraded with ominview/omnimon and extra memory (160k?)...depends on if I get a nice offer. Boy is it hard to part with these things!

In the future I am thinking of getting rid of some software, like Ultima II + III, AR:The Dungeon, Crush Crumble & Chomp, etc.

Located in Austin, Texas.

Everything is best offer.

Please reply via email: slycy@geocities.com

Yogi:

You're right. Fill 'er Up, the Qix-based arcade game published in Analog was better than the actual Qix conversion. It had cool sounds and pleasing graphics and EXCELLENT play value.

I suckered a friend who didn't know what he was getting into into typing the horrendous binary code listing in with me. I think we actually saved it to a cassette, then crossed our fingers (this after about 2 1/2 hours of typing) and booted the game, which ran flawlessly.

I must admit, I typed it in also. In fact, I think I typed in all
those ML analog games; most of them were pretty good (for freebies)

The 5200 version of qix is much better.

3518. monitor cable construction

Newsgroup: comp.sys.atari.8bit

I just built myself a monitor cable for my 800, and it worked just fine before I soldered the connections, but now the video is a bit fuzzy; it's like it's picking up interference from something, but I'm pretty sure nothing is running that should be doing so, though. My guess is that it has to do with the grounding. What's the correct thing to do? Should the shielding wires from both the audio and video be soldered together to the ground pin?

Source record: 64128

Aol just cut me off without warning. I might forget something.

The arm I'm using is the mobile armatron with the ribbon cable and hand held pendant. I was going to connect it up so each motor was controlled by two inputs. If one went high it went one direction, and the other reversed it. If both inputs go low it stops and I just have to hope I don't make both high.

I have the hardware manual for the atari 400/800 and I assume the sio part is the same for the xe. After looking at I still don't know what the computer sends out of the serial port. If I use the lprint command I just need the microcontroller to act like a printer. If it doesn't return the right response I get an error-138 or something but I can just trap it...

If I do go to all of the trouble to use a 68hc11 then I would like to be able to get data back from it as well. That way I will have 8 more A/D lines and many other nifty bits. I don't know where to begin and maybe I should just try to get the rest working reliably first. I have to fix the battery powered supply right now :-(

Thanks,

Patrick Robbins

I got an Atari 800 and it had an omnimon installed. It has a mess of wires soldered everywhere, but it has a ribbon with four wires and they have been cut. I assume they are for the switch that disables the board that Scott Charles mentions in his article in the Atari 8-bit FAQ. Am I right? Does anyone have a copy of the installation instructions?

Any and all help would be appreciated.

Also it has 3 16K cards in it. Is this stock or is there more memory under the casing and these 3 in the remaining three slots expanded?

Thanks,
Chuck

> Atari 800" (or something like that.) Has anyone else ever seen this, and
> can anyone tell me about it? I'd like to try to hunt down an original
disk
> if possible (even if it doesn't work).

Yep.. When I got my first 1050 (which came with DOS 3.0), a good friend
gave me 2.6f so that I would have a usable DOS. I used it for a long time
(never liked 2.0) until I started using Sparta and MyDOS. I am sure I
still have a copy of it around here somewhere.

Years ago, I bought a tiny amplified speaker from Radio Shack for about
$1.99 - I used this thing on my Atari for years until I got a monitor with
a speaker built in.

I see from the FAQ that pin 3 on the 5-pin din plug is "audio out". What
> do I need to do to hook that up to a pair of external speakers? Do I need
> to amplify the signal or can I just run a wire from pin 3 to a speaker?

That's how mine is wired.
It's likeley to be the power supply rectifiers are not doing their job very
well. The A800 has an AC adaptor as opposed to the more common DC type. So any
AC conversion is done within the machine.
You could try replacing them. That's my $0.019999's worth. :)

response
>I get an error-138 or something but I can just trap it...

SIO is part of the OS in every 8bit Atari, however, SIO treats most devices as
intelligent. They have a protocol , to acknowledge and request for I/O blocks.
(not the usual RS232 handshaking)
BTW, the cassette isn't expected to request or respond for data,
Implicit assumption that all is well. Until you try and load the darn
thing back, and the tape's shot.

Error 138 - 'Device does not respond', because your not sending back the ACK
response. $41
Expected SIO responses. depends on the operation expected. :-\
Nak - $4E device didn't understand
Complete - $43 operation successful.
Device Error - $45 it failed to carry out the requested operation.
TX baud rate 19,200

I shall take a look at SIO to see if it could be coaxed into acting more like a
normal serial controller. :)

3535. Koala/AtariArtist .PIC to .GIF

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-05 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6g7gur$l1k$1@newsd-199.bryant.webtv.net>
Source record: 63996

There is a program that converts .PIC files to .GIF files out there,
someone must have it. (I can't find mine) I believe there was also an ST
program that did the same thing, as I have the pictures I did with
AtariArtist as GIF files.

I did some great anime drawings (NOT SCANS) even with the (now) crude
resolution and limited (4 color) palette. I was able to get a little
artifacts in to get a couple of more colors in.

Q: What's the difference between Mechanical and Civil Engineers?
A: Mechanical Engineers design weapons, Civil Engineers design targets.

3536. Auction - Ends Tomorrow! - Last Newsgroup Update - 8-Bit

April Auction - Update 9

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, April 6 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

Super Nintendo
SN1. Super Nintendo System in excellent condition. Includes main unit, power pack, controller, rf cable, and instructions. -$22.95 min
SN2. Super Nintendo Stereo AV Cable -$5.95 matthew_stroup
SN3. Super Nintendo Super-VHS Cable -$8.95 matthew_stroup
SN4. Super Nintendo Super Mario All Stars. Complete in box with instructions. -$13.95 matthew_stroup
SN5. Super Nintendo Controller. Complete in original box. Never used. -$7.95 min
SN6. Super Nintendo Mortal Kombat II Instructions -$.25 min

Atari 5200 Single Cartridges
1. Defender (excellent label) -$1 diehardgatorfan
2. Dreadnaught Factor -$1.75 diehardgatorfan
3. Pac-man (excellent label) -$1 min
4. Super Breakout (very good label) -$1 diehardgatorfan

Atari 5200 Overlays
5. Pac-man (pair in excellent condition.) -$1.50 diehardgatorfan

Atari 5200 Manuals
6. Buck Rogers -$.75 diehardgatorfan
7. Congo Bongo -$.75 diehardgatorfan
8. Frogger -$.75 diehardgatorfan
9. Popeye -$.75 diehardgatorfan
10. Realsports Football and Home Football Playbook -$.75 diehardgatorfan
11. Realsports Tennis -$.75 diehardgatorfan
12. Super Cobra -$.75 diehardgatorfan

Atari 2600 Manuals
13. Asteroids, Atari (b&w, 5 languages) -$.50 min
14. Space Invaders, Atari (small black) -$.50 min
15. Haunted House, Atari (b&w) -$.75 djastroboy
16. Home Run, Atari (small black) -$.75 min
17. Star Trek, Sega -$1.25 dgeller
18. Street Racer, Atari (small black) -$.75 min
19. Super Breakout, Atari (colored) -$.75 min
20. Superman, Atari (small red) -$1.25 dgeller
21. Surround, Atari (small black) -$.75 min
22. Tennis, Activision (colored) -$.75 min
23. Towering Inferno, US Games -$1.25 dgeller
24. Video Chess, Atari (small black) -$1.25 dgeller
25. Video Olympics, Atari (colored) -$.75 min
26. Video Pinball, Atari (small colored) -$.75 min
27. Warlords, Atari (colored) -$.75 min
28. Congo Bongo, Sega -$1.25 min
29. Encounter at L-5, Data Age -$1.25 min
29a. Missile Command, Atari (colored) -$.75 min
30. Atari Force Comic Book #1 -$2.50 min
31. Atari Force Comic Book #2 -$2.50 min
32. Atari Force Comic Book #3 -$2.50 min

Atari 7800 Cartridges New in Boxes
33. Donkey Kong Jr. (without shrinkwrap) -$2 spearsk

Atari 8-Bit Computer/XE Game System Cartridges
34. Kindercomp cartridge. -$.50 min

Atari 8-Bit Computer - Disks
35. HomePak (flip side for C64), Batteries Included disk -$1 min
36. Ken Uston's Professional Blackjack (flip side for C-64) with Operating Instructions manual. -$1 min
37. Party Quiz Game Question Disk (General Edition 1), Suncom. Flip side for C-64. -$.50 min
38. F-15 Strike Eagle, Micropose disk -$1 min
39. Track Attack game disk, Broderbund -$1 min
40. Maxi Golf game, Activision 2 disk set -$1 min

Atari Controllers
41. Standard Atari Paddle Controllers (pair) -$1.95 djastroboy

42. Atari Standard Joystick (single) -$1.95 min
43. Atari Standard Joystick (single) -$1.95 min

Miscellaneous
44. Flip and File - Clear smoke colored plastic. Holds over 40 5 1/4 floppy disks (elephant disk sticker on front). -$1.95 min
45. Flip and File - Same as above. -$1.95 min
46. Media Mate. Holds approximately 35 3.5" disks. -$2.95 min
47. Media Mate. Holds approximately 35 3.5" disks. -$2.95 min
49. RF cable (fits Atari 7800/Colecovision) - approx. 12 feet long -$.50 min

Atari Computer Books/Manuals
50. Atari Personal Computer System Operating System User's Manual. CO16555 Nov. 1980. 215 pages. Add $1 to shipping. -$9.95 min
51. Atari Personal Computer System Hardware Manual. 10/1980. Add $1 to shipping. -$9.95 min
52. Atari 810 Disk Drive Owner's Guide. CO60056. Rev. 1 (full color). -$1 min
53. Energy Czar Computer Program Insts. (20 pages) -$.25 min
54. APX Ultimate Renumber Utility Insts. -$.25 min
55. APX Keyboard Organ Insts. -$.25 min
56. APX Sketchpad Insts. -$.25 min
57. APX Video Math Flashcards Insts. -$.25 min
58. APX Presidents of the United States Insts. -$.25 min
59. Master Memory Map by Santa Cruz Software. 100s of Important Memory Locations. Hints on Their Use. 14 pages of reference material. -$2.95 min
60. ANALOG Computing Pocket Reference Card. -$2.95 min
61. Teach and Talk Cassette Courseware Catalog. CO14732. Rev. 4 -$1 min
62. APX (Atari Program Exchange) Catalog Spring 1982. 68 pages. -$3.95 sydtech
63. APX Catalog Summer 1982. 76 pages. -$3.95 sydtech
64. APX Catalog Fall 1982. 76 pages. -$3.95 sydtech
65. APX Catalog Winter 1982-3. 85 pages. -$3.95 sydtech
66. APX Catalog Spring 1983. 37 pages. -$3.95 sydtech
67. APX Catalog Summer 1983. 38 pages. -$3.95 sydtech
67a. APX Catalog Fall 1983. 72 pages. -$3.95 sydtech
68. Atari Dealer Confidential Price List. Effective June 1, 1983 -$4.95 min

Game Catalogs
69. Atari 2600 Red CO-12737-02 7/78. 20 Games on chart. -$.50 loverroi
70. Atari 2600 Yellow CO14356-Rev. C. 1979(some writing). 32 Games on chart. -$.50 loverroi
71. Atari 2600 Blue CO14356-Rev. D 1980. -$.50 loverroi
72. Atari 2600 Red CO16725 Rev D 1981 45 Game Program Cartridges. -$.50 loverroi
73. Avalon Hill Games and Parts Price List, effective September 15, 1983 -$.50 min

Atari 8-Bit Computer Manuals
74. BC's Quest for Tires, Sierra -$1.95 min
75. Blue Max, Synapse -$1.95 min
76. Capture the Flag, Sirius -$1.95 JMouchmino
77. Centipede, Atari -$1.95 min

78. Clowns and Balloons, Datasoft -$1.95 min
79. Demon Attack, Imagic -$1.95 min
80. Dig Dug, Atari -$1.95 min
81. Final Legacy, Atari -$1.95 min
82. Flight Simulator II Reference Chart -$1.95 min
83. Flip and Flop, First Star -$1.95 min
84. Gorf, Roklan -$1.95 min
85. Gruds in Space, Sirius -$1.95 min
86. Gyruss, Parker Bros. -$1.95 min
87. H.E.R.O., Activision -$1.95 min
88. Hard Hat Mack Command Summary Card, Activision -$1.95 min
89. Joust, Atari -$1.95 min
90. Jumpman Jr. Epyx -$1.95 min
91. Keystone Kapers, Activision -$1.95 min
92. K-razy Antiks -$1.95 min
93. K-razy Kritters -$1.95 min
94. K-razy Shootout -$1.95 min
95. K-Star Patrol -$1.95 min
96. Master of the Lamps, Activision -$1.95 min
97. Megamania, Activision -$1.95 min
99. Monster Maze, Epyx -$1.95 min
100. Mr. Do!, Datasoft -$1.95 min
101. On-Track Racing, Gamestar -$1.95 min
102. Pac-Man, Atari -$1.95 min
103. Pharaoh's Pyramid, Master Control Software -$1.95 min
104. Pool 400, Innovative Design -$1.95 min
105. Rainbow Walker, Synapse -$1.95 min
106. Repton, Sirius (includes iron-on) -$1.95 min
107. Rescue at Rigel, Reference Card and Loading Insts. -$1.95 min
108. Return of Heracles, Quality Software -$1.95 min
109. Robotron, Atari -$1.95 min
110. Shooting Arcade, Datasoft -$1.95 min
111. Silent Service, Microprose -$1.95 min
112. Snokie, Funsoft -$1.95 min
113. Star Trek 3.5, Adventure International -$1.95 JMouchmino
114. Super Cobra, Parker -$1.95 min
115. Track Attack, Broderbund -$1.95 min
116. Wizard of Wor, Roklan -$1.95 min
117. Zaxxon, Sega -$1.95 min
118. Pitfall
119. Encounter!, Synapse

IBM PC
IBM1. Microsoft Flight Simulator for Windows 95 CD. Complete in original box. -$12.95 min
IBM2. Toolworks Reference Library. Complete in original box. -$1.95 min
IBM3. Chuck Yeager Air Combat. 4 disks/manual. For Gravis Ultrasound. -$1.95 min
IBM4. Peak Net.Jet - Real-time web accelerator. Increases modem utilization up to 9 times. Add-on for Netscape or Explorer. CD. Complete in original box.

-$6.95 min

3537. Re: Help with Omnimon and Atari 800

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-05 00:00:00 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <6g83mj$js1$1@pale-rider.INS.CWRU.Edu>
Source record: 63998

I ain't gonna answer the question. This 'nospam' stuff is
a pain in the ass. I responded, took a few minutes of typing.
Then bounced because of the 'nospam' address.

3538. Atari 8-Bit Computers: Vendors and Developers

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-05 00:00:00 UTC

Welcome to the comp.sys.atari.8bit newsgroup!

Atari 8-Bit Computers

Vendors and Developers List

"A comprehensive list of vendors, developers, publishers,
and repair shops for Atari 8-bit computers and their users"

Additions/suggestions/comments/corrections are needed! Please send to:

Michael Current
mailto:mcurrent@carleton.edu

Please refer to the latest version of this FAQ list whenever possible!

Available via these locations and Usenet FAQ archives everywhere:

http://www.faqs.org/faqs/atari-8-bit/vendev/

ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.
```

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection.

Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*. If there is no copyright notice, software must be considered Freeware rather than in the Public Domain.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of my more prominent sources:
- Atari Classics, published by Bob Woolley
- New Atari User, published by Page 6 Publishing (Les and Sandy Ellingham)

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this

list, please do your part in keeping it useful for everyone!

So don't respond. If he wants to try to keep his mailbox free of garbage, he has that right. It's not like this is a new practice. I always check the return address for obvious removals before responding. You should to.

Bloody hell!

How long has it been since they produced their previous issue? I heard that Les had work commitments and couldn't produce them as regularly. I just wonder if this issue is a flash in the pan or if they'll be trying to get back up to
speed again.

If they are going to produce the mag bi-monthly again then I for one would welcome it.

I don't suppose they've been able to reproduce it to its previous high quality
on art paper? No, I don't suppose they could ... it would cost too much.

David

3542. Re: Emulator

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-05 00:00:00 UTC
From: arickett@kent.edu
Message-ID: <6g94vq$4jb$1@usenet.kent.edu>
Source record: 64003

There are several Atari 8-bit emulators I've come across for the PC.
The best ones I've found are XL-it!, Atari800win, and Rainbow95.
The last two run under Windows 95, and XL-it! runs under DOS. Given
that XL-it! is no longer in development (or at least, active development),
Atari800win looks to be the best bet for the future. The graphics and
sound are *very* good, and compatability is improving. There are some
bugs still, but they are fairly minor (as of v. 1.9). Hope this helps.

How does a person with a 130XE, a BB or MIO, and Ice-T 2.72
access IRC via Telnet? I would like to participate on #Atari8,
but don't know how to get there in the first place.

I most likely won't be here for a few days as I'm finally going
to be able to format a hard drive I got recently to replace
a fried one. I've been on just two floppy drives in the
meantime (yes, I access the Net with it, so you can see how
cramped it is). Thank you for any information.

Bill:

I don't know about getting on IRC via Telnet via an Atari, but I have been on the Atari8 channel. I never saw more than 2 other people on that channel. I met the author of Term80 there, though. I went back to the channel a few times but it was almost always empty, and I gave up on it.

If anyone is going to try and make #atari8 work for 8bit fans I would recommend setting up a time for everyone to meet. Set the date well in advance and advertise a little.

I personally would like to be there. Someone with a little experience would have to designate a server and be aware of the technical difficulties.

Emulators Inc., makers of the PC Xformer Atari 8-bit emulator for MS-DOS
are now shipping the latest XFORMER 98 Atari 8-bit emulator for Windows 95,
Windows 98, and Windows NT.

Xformer 98 has full support for all Windows compatible joysticks,
emulates true 4-channel POKEY sound, and runs even more Atari programs than
PC Xformer. Xformer 98 can run either windowed or full screen, and is
32-bit optimized for Windows to run better than PC Xformer in the
multitasking environment of Windows.

Xformer 98 now also supports German, French, and Dutch keyboards.

Download your FREE DEMO version of Xformer 98 immediately from:

http://www.emulators.com

and also find out about our Apple Macintosh and Atari ST emulators for
Windows.

3549. Tech Help Request: Happy(?) 810

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-06 00:00:00 UTC
From: mbates@s3.sonnet.com
Message-ID: <mbates-0604980207560001@ppp66-pac.sonnet.com>
Source record: 64010

I purchase an oddity the other day and am having trouble figuring out just exactly what it is.

It is an 810 mech in side of a jet black enclosure. The normal daughterboard on the main 810 motherboard is different than normal. AND has a chip in it lablled "Copyreight 1982 Happy COmputing" Obviously some kind of Happy Drive.

It also has a toggle switch mounted on the front of the drive. The switch does not seem to correspondf with write protect as I can format in either position.

Also, I have version 7.10 of the happy program (for my Happy 1050) and it does nto recognize the drive as Happy.

The drive functions normally otherwise. Any ideas as to what it is?

Thanks
-Marlin

3550. FT:Ultima II (complete)

3551. 1010 Problems

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-06 00:00:00 UTC
From: Stephen Knox <gooch@erols.comX>
Message-ID: <3528CFF1.32A1261D@erols.comX>
Source record: 64012

I got a 1010 recorder awhile back but had no tapes so i created a simple basic program saved it and reloaded it without a problem (It was 1 burst long).

Anyhow,
I came across some more tapes and none of them would work. Most of the tapes would load for a little bit and error out. Example - Temple of Apshai (basic version) would load for about 11 bursts and then get a 140 or 143 error.

So,
I went back to my simple basic program and expanded it so it would be more than 1 burst and when I try to CLOAD it I get the 140 adn 143 error.

I ran a head cleaner/demagnitizer to no avail.

Any ideas?

Did you try to adjust the head ? You should have a clear as possible tone.
Insert a tape and try to adjust it while the sound is there. You might have
to remove the tape holder (or lid or whatever) to get to the screws. That's
usually does it for my recorders. 410/1010/XC-12.

Take Atarian care

It was about 2 months since the previous issue, the usual length of time.

The amount of time between issues 81 and 82 was indeed much longer, more
like 6 months. But they seem to be back on schedule now.

This is a list of Atari 8 bit computer CARTRIDGES that I would like to buy from anybody that's willing to sell any of them. I got quite a few responses last time I posted this list, so I am trying again in the hope that I can pick up a title or two that I don't have. Here goes:

The Dreadnought Factor
Rally Speedway
Crystal Castles
Seafox
Serpentine
Bounty Bob Strikes Back
Blue Print
Omega Race
Satan's Hollow
Solar Fox
Boulder Dash
Gyruss
James Bond 007
Risk
Tutankham
Star Trek
Super Zaxxon
Tapper
Up 'N Down
Jawbreaker
Sammy Lightfoot
Worm War 1
Drelbs
Fort Apocalypse
The Pharoah's Curse
Shadow World
Slamball
Survivor
Orc Attack

Thanks for taking the time to read this. Take care.

Actually I think these are binary load tapes. They cannot be loaded in
BASIC as I think you tried. Try to do this instead:

1. Put your tape an wind the tape to the beginning. Press PLAY on the
tape player.
2. Turn your computer on while holding the START and the OPTION key
down. OPTION disables BASIC and START tells the computer
that you want to load a tape.
3. If the computer makes a beep sound press any key (enter for example).
This should tell the computer that you have pressed PLAY on the
tape player.

It was a very long time since I used the tape on my Atari, but i hope the
above is correct.

Good luck

Well, #atari8 is a channel where are generally
people from Poland (like me), sometimes there are
more atarians (in the morning, at the weekend).
I am going to write some web stuff for Atari, but
I am looking for data about transmission... BTW:
What are BB, MIO and Ice-T 2.72???

I have tested it, but XL IT 0.20 is much better!
Xformer 98 has bad sound, really... and all good
demos don't work well IF they work...
Anyway emulator is too slow. I have Pentium MMX
233 and it runs slowly even on half of screen!
To Darek: If You want I can tell You what is wrong
exactly.

Which flavour of Omnimon do you have? With or without the Omniview
80 column option? Is it the piggyback version, or does it make use of
the OSN replacement OS board?

I've got docs for most of this stuff in my basement. It shouldn't be
too difficult to pull 'em out. Let me know exactly what configuration
you've got and I'll see what I can find.

Get a SIO2PC PC Comm. port to Atari SIO bus converter. They run
anywhere for $35-69 dollars. Then get Atari Peripheral Emulator
(A.P.E.) 1.16 (shareware version works fine) and mount the ATR's.
Then you will be able to load the ATR's into your Atari XE from your
PC. If you want to copy the ATR's to floppy, this arrangement will
work: just put the 1050 drive at an address that is not currently
mounted in A.P.E.. For Example, you set your 1050 to address 2, and
then boot Copymate from A.P.E. mounted ATR disk 1and then put the ATR
you want to copy as A.P.E. mounted disk 3. It takes very little
practice and I have done this several times with great success.

You can get the A.P.E. software (shareware or licensed) and buy a
SIO2PC from http://seka.nacs.net/~classics/

3566. Converting images to Atari disks in PC drives?

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-06 00:00:00 UTC
From: ae922@sfn.saskatoon.sk.ca
Message-ID: <6gbda0fsp1@missing.its.to>
Source record: 64027

Hallo!

I have a quick question, folks =)

I just finally got myself a new working atari 8 bit machine... and I dug around and it seems that I tossed all my disks out..

In the past, I have gotten emulators and tried to run 8bit game images on my PC.. but they ended up running too slow. So I wanted to know if there was a way I could put these images on disks for use with the Atari computer... without building a bunch of cables. (I near failed the solder-the-wires portion of the comp. tech class I took, I cannot for the life of me solder anything together properly)..

I saw a bunch of things for copying single files to disks using PC disk drives? But I dunno... none of 'em came with any real instructions =) So I have had problems figuring them out!

Basically I just wanna find something that'll let me pop a disk in my drive, type some big thingy on a command line, and it'll put the image on the disk in an atari format! Does *anything* like that exist???

Thanks!! =)

Of course I have :)! It's FAR WORSE than eg. ATARI800 (version for Windows
or DOS) :((((!!! If you want to waste your money, buy it! However, I
suggest you check out some of the much better emulators first :)! If you
really want to purchase a commercial emulator (why?) try RAINBOW (check
out my homepage for the correct link).

>Especially fill er up
>

Good question. Those Analog games are indeed Public Domain, meaning that you are free to type the games in from the magazine, or you can get copies that were typed in from someone you know.

They are also copyrighted. This means that you may NOT charge anyone for the games, since the original writer still retains all rights to redistribute the games. You have to remember that back then nobody had coined the term "freeware." If you look at the definition of "freeware," I would say that Analog's perspective on their games was very similar. Just take one look through their magazine and you'll see that they are giving away their games in every issue, but they are not allowing you to sell them to anyone else. Most of the Analog programmers were "in-house," so the copyright was there to protect them from having an outside company stealing their design concept and then trying to sell it for a profit.

As far as posting the files on the net, I think the programmers would be proud to know that their work is still available for 8-bitters. It would be nice to hear from the likes of Tom Hudson or Charles Bachand or any other of the Analog staff to find out their position on this.

BTW: I agree with you about Fill-'er-up! I have both it and Qix, and Fill-'er-up! is much smoother and has better play action than Qix, IMHO.

Thanks for the responses. Yes, I know it's APX, but in my circle of Atari friends, we always called it "apex" since it was easier to say.

Now that you mention it, I have seen a few of those titles scattered about here and there myself.

Looks like we'll never see an archive, huh?

Larry,

Don't worry, I did the same thing when I went out to Sunnyvale last year, I drove past many of Atari's old haunts just to see the buildings and I too had hoped that perhaps somewhere off to the side I would see the old Atari sign or something, so kind of lasting memory left behind to say that this was once the Crystal Castle where dreams were made for millions and millions were made from dreams...

Oh, there's a utility called "Ataridisk" ... hmm ... I don't know if it's
somewhere on the net.
But, hey, I can send you that!! email me.

It's a DOS-program, menu-driven...
mount PC-Disk-drive, select files to copy and: copy!

That works for files, if you want to copy images ... hmmm.

I always use kinda "trick": with "Diskcommunicator":

Start emulator with one ".atr" and the Diskcommunicator,
make a ".dcm" (or ".dc3") file out of that,
copy this ".dcm" file to disk (with "Ataridisk"),
start your ol'Atari, with "Diskcommunicator", extract the disk - ready.
Hope this is kinda helpfull.

There is a PC utility called MYUTIL. Its command line (dos) and lets you
view/copy files on an Atari formatted diskette. Unfortunately, its very
picky about the hardware it runs on. It works well on very old machines
but will likely crap out on new hardware....don't ask me about the
technical reasons...it just is :-)

Anyone who wants it can email me. I originally got it from some Yogi(?)
site. BTW, it reads/writes DD diskettes, not enhanced or SD.

Although I could not write an emulator for the Atari I do understand
some aspects of sales and business.

I don't see how someone could release an emulator thats not as good as
very well known *FREE* alternatives. Sure, it works but even Xl-it
which has been all but cancelled since last year is almost on par with
XF98...?????

The Atari800 dos & windows versions are far better as far as I can see
in almost every department. So a massive well done to David, Rich and
all the A800 developers for providing very high quality emu's that are
FREE...

Also a well done to Chris Lam who's emu is half the price and seems
very nice tho I have not played more than the demo version.

> Delusion@wcoil.com

Done, simultaneously with posting; I felt it was an interesting list deserving of public view.

> 1. Does the 8Bit have a decent GUI now

Not in the sense I assume you mean. The 8bit still has exactly the same "look and feel" it always did... thank goodness!

> 2.Is Sparta DOS still going strong?

Yup. Also SpartaDOS X, a cartridge-based version which you might not have been aware of.

> 3.How fast can I get it now, and how much ram?

Stock machines are the same as ever: 1.79MHz, 64K. Some of the later models (I don't know exactly WHEN you got "out of the scene") had up to 128K or thereabouts, and there are third-party RAM upgrades/expansions that can go as high as 1Meg. I don't know whether the usefulness of these are limited to the use of specially-compatible software, but I expect that may be the case.

> 4.Is there a TCP/IP program yet? If so then FTP/IRC?????

No. However, a fellow named Andre Fachat has created a TCP/IP stack for the C-64, so the "technical feasibility" of doing it on the Atari is a little closer to possibility than I would've said before.

> 5.CD-ROM support?

Actually, yes, in a manner of speaking. Several third-party hardware accessories, such as the "Black Box" and the "Multi I/O" (or "MIO"), give Atari XL- and XE-series machines SCSI HD capability (among other things). Presumably a SCSI CD-ROM drive would be compatible with this hardware. In and of themselves, however, these products would only be able to handle CD-ROMs which were written in Atari-8-bit-specific file-system formats (SpartaDOS or MyDOS being the two most frequently seen). High Sierra or ISO-9660 CD-ROMs might be readable "at the disk-sector level," permitting you to WRITE software to interpret those filesystems, but as far as I know this software does not currently exist.

> 6.Where do I get files?

All over the place. :-) There are numerous WWW archives, FTP archives, and the private collections of the readership of comp.sys.atari.8bit; there are even a few diehard Atari BBSes still in operation.

> 7.Was Ape ever ported to the Amiga yet??

I have no idea. If you find out that it was, LET ME KNOW!!!!!! :-)

> 8.Is the X-Windows prodject still going on?

Do you mean the ORIGINAL X-Windows project at MIT? Not as far as I know. Even the OSF or FSF (I forget which) X support website has been dismantled. X is considered largely "dead" -- though we program with X/Motif every day, where I work.

> XDelusion Amiga user and Jay Minor freak! :)

In case you hadn't heard, Jay Miner (note spelling) passed away a few years ago. R.I.P. ...

> Oh, are there any Atari 8Bit IRC rooms?

Looks like the newsgroup membership were just discussing that. Seems to be some interest in a #atari8 channel which already exists but has not seen much traffic. I suspect that one problem may be that, like me until quite recently, many people don't realize that you have to attach to a SPECIFIC SERVER in order to see the "same" incarnation of a channel. I.e., if I go to MY IRC server and /join #atari8, and YOU got to YOUR IRC server and /join #atari8, you and I WON'T SEE EACH OTHER. Once this fact becomes common knowledge, the use of the #atari8 channel MAY pick up a bit!

Hope this helps,

Freeware may not have been a popular term yet, in the early days of ANALOG, but the law itself hasn't changed much in the interim.

Public Domain and Copyrighted are mutually exclusive. The very definition of public domain is, something that is not copyrighted. No one has any ownership over property in the public domain.

Intellectual property that is copyrighted may be sold commercially, or it may be for free distribution, depending on the wishes of the copyright holder.

Notices such as "This is released into the public domain. Not for commercial sale without permission of the author" don't make any sense and are legally ambiguous.

If ANALOG games are indeed still copyrighted (I believe they are), then they are by definition not in the public domain. But that doesn't suggest, one way or the other, whether they are supposed to be freely distributed or not. Last time I looked into it I didn't think so, but for one thing I was hampered by a very incomplete set of ANALOGs to work with.

Well, depends.
What's the status of APX programs today?
Who has the rights to those programs?
Is it PD?
Shareware?
None of the above, and is it commercial?

Bo.

>What are BB, MIO and Ice-T 2.72???
Ice-T is an 80-column term program by Itay Chamiel.
BB==Black Box, MIO=Multi I/O. These are both interfaces for the XL/XE computers, containing a printer port, a serial port, and a SCSI hard-disk port. The MIO was made by ICD, and it also contains a ramdisk. The BB was made by CSS, it is compatible with more SCSI drives, and with an optional floppy board it can control double- and high-density floppy drives.

Irc servers are networked. There is more than one irc
network. (Efnet, undernet, dalnet, etc...) You can see people on
different servers that are on the same irc network as you. You will
not see people on other networks.

Yeah I remember Dos 2.6f.. it was kind of a hacked dos 2.0, will special options like RPM test floppy drive and things like that. If I remember right, it was VERY close to SmartDos. There certainly were a tonne of DOS' for the Atari 8bit. Dos 1.0, Dos 2.0s, Dos 2.0d, Dos 2.5, Dos 2.6f, Dos Xl, Dos Xe, SuperDos (never did use that one), Top Dos (a million versions of this one), SpartaDos (a million versions of that one), MyDos, BIBI dos (never used that one either)...

> Any ideas?

Error 140 and/or Error 143 are pretty serious errors.. usually indicating the device has died. It may be a cable problem. you said you ran the head cleaner/demagnetizer already. But it is a little odd that you can save and load small programs. Maybe your tapes are so old that they simply become too stretched out. (most cassette tapes have a relatively short life span..)

Hey... I've been there... Done that. Even tried it with PLAYBOY back in
Chicago when they were really hot. I hoped to meet a Playmate <grin>.
Silicon Valley changes so much, so fast that... at least you can say...
that the Pilgramage did indeed beat "Room Service". Take care.

So, like many r.g.v.c-ers, I've been an Atari fan right from the beginning. My older sister and her husband got one right when they first hit the market, and I used to love going over to their house 'cuz I could sleep on the couch in the living room...and sneak playing the 2600 with the volume down all night. Hey, what more could an 11-year-old ask for? I was such an Atari freak that *to this day* I still remember their old toll-free 800 number (800-538-8543 - don't bother dialing it, it's NOT Atari's anymore. Obviously!). I remember calling once and managing to get the guy to send me a copy of every single one of the instruction books for the 2600. Sigh.

Anyway, I always figured that if I ever got the chance to go to Sunnyvale, I'd check out Atari at the ever-popular 1195 Borregas Avenue location included in the back of all their docs. Well, better late than never...

I made the trek today. A lot of confusing dead ends (two major freeways intersect Borregas Ave), and I cruised by a lot of current Silicon Valley heavyweights and hyped-heavyweights (Netscape, Pointcast, Marimba, MPlayer, etc)...but after wandering past the huge Lockheed Martin complex (cool dish antennas!) I finally I found the right part of Borregas Ave., and the remnants of what USED to be Atari.

Typical Silicon Valley industrial park design - low slung grey and glass. A company called 'Pragmatech' is there now; apparently they manufactur parts for network cards and the like. I did a slow cruise through the parking lot once or twice (what was I expecting - an Atari sign in the trash in the back? what?), parked the rental-cruiser out front (oblivious to the glances of some of the ID-tag-branded Pragmatech employees getting off shift), and stepped out. This mythical location in a far-off place called Sunnyvale really fired my imagination as a pre-teenager. Now here I was, 20-years later...

...and then the obvious thought occurred: what the hell was the point of THIS? Atari as I knew it is long gone...pooft...no more. Shuffled off this mortal coil. An ex-parrot. Bought by a disk drive company, for crying out loud! All that's left now are the remnants of their warehouses, scattered to all points and available to the hardcore from holdouts like Best Electronics, Toad Computer, and Video 61. And, of course, we'll always have the games - both the physical carts, and the *real* soul - the ROM images - floating around the 'net. I can always fire up PCAE! Hey, maybe Hasbro will do something interesting...we could hope.

What the hell. I walked up to the building like a total freak and touched the door handle, feeling like an idiot but oddly satisfied at the same time. Beat the shit out of hanging out in the hotel room ordering room service, anyway.

I have been out of the Atari 8-Bit sceen for a while, so I need you guys to e-mail me a few answers if you will at:

Delusion@wcoil.com

1. Does the 8Bit have a decent GUI now?

2.Is Sparta DOS still going strong?

3.How fast can I get it now, and how much ram?

4.Is there a TCP/IP program yet? If so then FTP/IRC?????

5.CD-ROM support?

6.Where do I get files?

7.Was Ape ever ported to the Amiga yet??

8.Is the X-Windows prodject still going on?

Thankx

XDelusion Amiga user and Jay Minor freak! :)

Oh, are there any Atari 8Bit IRC rooms?

Jon,
I just got my update version from the old version a couple of days ago.
So far I like it. It seems a bit smoother than 3.60. I haven't had time
to put it through its paces yet, but soon... I'm assuming that the
XFcable still works with this version.
The only problem so far is that I don't think it likes the Banyan Vines
network software I'm running here at work. It locked up the machine a
couple of times. The Vines stuff makes lots of programs finicky. One
thing though is that it does seem to print to the network printer HP
LJ4+ OK and it can pull files off my network and ZIP drive OK. We'll see
how good the sound is (suppose to be improved).
Once I redo my home PC, it's game time!!!

Jason,
The closest thing to using a real Atari 8-bit with REAL Atari 8-bit formatted disks on a PC is PC Xformer 3.60 or PCXf98 an XF cable and a REAL Atari Floppy drive connected. It works pretty well, albeit, not perfectly. At least you can boot from the floppy and run most stuff on the emulator. I can run most of my collection on it. I use this configuration to backup my Atari disks to my ZIP drive and to copy files to the disk image files specifically for the emulator. This last thing is better done through A.P.E. and an SIO2PC cable, but it works none-the-less.
However, if you want the REAL thing, use the real 8-bit system. You can't beat it!

Double density is no problem, as commerical kits like the ICD US
Doubler exist for providing this. (Although where to get one currently
at a reasonable price is information I do not have at hand). Double
side + double density is another matter. Even if possible, getting an
XF551 instead would likely be less expensive, and almost certainly
easier.

Seems typical of all of Dareks releases. All hype and very little
delivery. He seems to like charging for upgrades of bug fixes vs
delivering a solid product out of the box. I've given up on any
Xformer/Gemulator related products. Like others have said the shareware
stuff is WORLDS better than anything Darek has done.

Just my $0.02

Larry, I wouldn't feel bad about this... I know just where you're coming from. For years, I wanted to go to a ToadFest, and what with my work schedule (I pull 12 hour shifts, on midnights), and my 7 year old, I never could seem to get there. Finally, one year, I had it all setup to go by Greyhound bus (8-9 hours 1 way, 5 bus changes). Guess what happened? That was the year they moved it from the beginning of Dec. to October. Coincidentally, it was also their last...I couldn't change my schedule to accomodate the new time so there ya go... ;(

Still, even though they've now (pretty well) dropped Atari support, I would still like to drop by some time and say hello to Dave and Jennifer. I know it wouldn't be the same though,
but they were such a big part of my (Atari) life at one time... C-ya later! ;-)

Sounds cool. But the date on this message make me believe it's an April
Fools joke. BOOOOOOOOOOOH!!!!

Just a few days ago, I looked at the box of my XEGS again (still have to
fix it, has a reddish/brownish screen if I remember correctly) and saw
that picture again that is also on the 130XE box. This nice looking grey
colored disk drive (which according to somebody here, I believe it was
Curt Vendel, was a 1050 in a new case. SIGH. Wouldn't that be nice to
have....even just the case....that do the Double Sided thingy mentioned
above.......

CU Mathy Van Nisselroy

PS Please tell me if it was a joke or not.

When I look back at what I previously wrote, I think I was confusing myself. Analog Magazine meant for the type-in games to be freely available to all magazine subscribers and to those who bought the individual issues. Mag-on-disk subscribers paid an additional fee to get a disk of all the programs in the magazine. Each program carried it's own copyright notice; this means that they are NOT in the public domain. So what I said before is incorrect. My apologies :-(

I guess it's like those children's book & records. The record is a "freebie," but you still can't copy it for everyone else.

Well, here's a thought...

I had a 1010 recorder not too long ago which was used very little. It
would not work either. Basically the problem was that the mechanism
inside has a rubber tire on an idler wheel and on mine the tire had a
flat spot on it. So, you may want to check and see if the rubber parts
in the drive are okay.

You can still buy them in original packaging from B&C Computervisions. Their web site, www.myatari.com, has a good listing of almost everything they sell. If you don't see what you're looking for, just ask them.

3609. Internet by 8-bit Atari

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-08 00:00:00 UTC
From: alex6502@friko.onet.pl
Message-ID: <6gge1nhkg1@nnrp1.dejanews.com>
Source record: 63970

Since last year I decided to write some Internet stuff for 8-bit Atari and Atari Portfolio (which is actually a PC XT computer...). First of all I am going to write an e-mail client! Next would be probably FTP client, Web Browser (text mode) and IRC. Or maybe IRC first?
Anyway, I have read that on C-64 someone have written a FTP client with TCP/IP stack (I thought that PPP is needed too). If this information is correct, there is a possibility to convert these programs into Atari! That is easy, because CPU is more-less the same (100% software compatibile). Modem driver is also simple. But how to get this software and who might to explain me how does PPP and TCP/IP works together (and with Netcsape). What commands are for opening POP3 port to receive mail??? I have alreadry downloaded POP3, SMTP and TCP/IP references. First two are very easy! (they're using TELNET), but that third one...

Depends on what it is of course. Here in Norway $3 is not too bad for a game, especially if it's boxed and complete. I wouldn't pay $3 for Combat for the VCS 2600, but I would pay $50 for Starfleet I for the Atari 8-bit.
Take Atarian care

Hi Bill;
I think Dalnet carries #atari8, do the following;

telnet://telnet.dal.net

At the login prompt, type;

dalnet

If prompted for a password, just hit enter. You should
be able to navigate to #atari8 from there.......

I use my SIO2PC cable for moving data back and forth without a problem. The XFormer cable is ONLY 1 way and very unreliable (very picky when starting up). If you have a drive that supports DD then you can use MyUtil to move files directly from your IBM to an Atari formatted floppy.

SIO2PC works great though.

I also thought that one of the front ends supports SIO2PC, APE maybe?

I would recommend NOT getting the original XEGS power supply, it is only rated at 1 amp. Use the one for the 800XL/130XE machines. They are rated at 1.5 amps, and the later ones are ventilated instead of a solid epoxy-filled brick.

Spammers and other obnoxious morons cheerfully ignored.

3620. A premium site

Newsgroup: comp.sys.atari.8bit

Source record: 63887

Hello,

I discovered a premium Atari site in New Zeland that has the
emulators and over 100 *.atr's. I also found that their *.atr storage
method is unique because they only store a single program and an
autoloader (with a "k" when it boots???) thus minimizing the size to
less than the usual 90k I would expect a normal *.atr to have.
It is at:

http://shell.ihug.co.nz/~aaronat/atari2.html

----

in an unrelated issue, the SPAM mail that is generated from posting to
this newsgroup and this server is from auto-mailers that extract
e-mail address from postings. That is why I put the NOSPAM in front of
my e-mail address to trick the automailers into posting to a bogus
address. The infinte "over 58 million address" SPAM mail that I do
get, I usually get 2 or 3 times, indicating that my original address
must be duplicated 2 or 3 times, so their number of valid addresses is
wrong. Most auto-mailers don't know they are sending duplicate
mailings....
The oddest SPAM mail I received was from "Scared Sky" which claimed a
part of North Carolina would be spared at the end of the world, which
was coming, soon. For a small charge, you could be spared!

Hope this helps you guys wanting power supply info for the Atari's.

Here's the piece from a FAQ :

Subject: 13.3) What are the power-supply requirements for my Atari
components?

Thanks to Matthias Belitz, mailto:matz@kawo2.rwth-aachen.de for the
European
data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output). The
power (in watts) and current (in amperes) specifications of the original
equipment as presented here should be regarded as minimum values.
Higher-than-specified power and current capacities are entirely usable,
and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz
==========
9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer : 1030

9 V DC 200 mA (1.8 W) adapter : MPP1000C (the modem from MPP, interfaces
via a joystick port)
9 V DC 500 mA (4.5 W) Atari#CO16353 adapter : XEP80,SX212,2600
9 V DC 500 mA (4.5 W) Atari#CA014034 adapter : XEP80,SX212,2600
9.3 V DC 1.93 A (18 W) Atari#CO18187 adapter : Indus GT,5200
11.5 V DC 1.95 A (22 W) Atari#CA019141 adapter : Indus GT,5200
5 V / 12 V DC 1.1 A (5.5 W / 13.2 W) Atari#CO62297/DV1450 adapter :
1400XL,1450XLD

E U R O P E (and elsewhere?) INPUT = 220 V AC, 50 Hz
==========
5 V DC 1,8 A, #CO61763-107: 800XL
5 V DC 1,5 A (7,5 W) #CO61763-34 : 800XL (U.K., 240 V AC in)
5 V DC 1.5 A (7.5 W) #CO61763-11 : 65XE,800XL,800XE
two ones with the same part number, but different cases and different
input Values :#1, 65XE (Poland, made in Taiwan), Input 22 VA
#2, 800XL, Input 26 VA
9 V AC 27 VA (3.0 A) CO60592-34 : 1050
9V AC 0,5 A, CO#61516 : 1010
9,3V AC, 1,66 A CO# (not printed), FW 6799: 800

These draw their power from the SIO +5 V:
XM301 (60 mA),XC12,ICD/FTe P:R:Connection

Draws power from the 600XL PBI:
1064

These have built-in power supplies (plug directly into the wall):
410,815,820,825,1025,1029,XMM801,XDM121

The power supply requirements for the following are still needed:
??? V DC ???? A (???? W) Atari#CA060535 adapter:
835

XC11 program recorder (no brick needed -> internal or SIO source?)

OTHER:
The ICD/FTe Multi I/O (MIO), all versions, can use both AC and DC supplies.
But stick to voltages of at least 6.2-7.2 V.

Hmmm.... then they should not have printed "This is this issue's
PUBLIC DOMAIN type-in game."

3624. Hardware interfacing an Atari 1020 printer

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-09 00:00:00 UTC
From: rrs0059@ibm.net
Message-ID: <352d129c.0@news3.ibm.net>
Source record: 63891

I needed a small and reasonably-priced printer for a home data-logging project. The nice RS232 printers start at $130, so I'm trying to use an Atari 1020 Color Printer ($15-20) and trade my coding skills, sweat, and soldering gun for the other $100 (may be a losing battle (;-)).

Can anyone point me at sources which might help me drive a 1020 from an embedded microprocessor?

Here's what I have so far...

1) Atari 1020 Color Printer Field Service Manual. Circuit diagram, disassembly, and maintenance information, but lacks ROM listings for the printer's two 6805 uPs. Also no description of the command protocols used by the printer for basic data transfer, nor any hint at the supported Esc sequences.

2) 1020 User manual. Offers some information on printer Esc sequences.

3) The online Atari Technical Reference Manual (400, 800, etc.) kindly provided at http://aegis.mcs.kent.edu/~clisowsk/8bit/atrtblc.html. Chapter 13 describes the SIO interface, and gives some informaiton about the communication sequences.

My reading of these says that I need to do the following to communicate with the 1020 ("Out" in the documentation apparently refers to "Out from processor, and "In" refers to "In to processor"):

1) Pull the /CMD line low.
2) Clock the following bytes onto pin 5 (Data Out) at 19200 Baud:
DDEVIC/DCOMMND/DAUX1/DAUX2/CHECKSUM
0x40 / 0x57 / 0x00/ 0x00/ 0x97
3) Bring the /CMD line high.
4) The printer should send back either 0x41 ("ACK") or 0x4E ("NAK").

Assuming I ever get an ACK (;-), I then send a "data frame", which appears to be just the output data/Esc strings, followed by a checksum. The printer will respond with 0x43 ("End - OK") or 0x45 ("End - Error").

All this leaves some points unclear:

a) I'm assuming that WRITE (0x57) is the appropriate command byte to send. Can anyone confirm this? Is there a list of the command bytes that the 1020 responds to?

b) I'm assuming that the printer ignores DAUX1 and DAUX2. Can anyone confirm this?

c) The data "packet" does not have a length attribute. What terminates it, from the printer's point of view? How does the printer _know_ whether a byte represents the trailing checksum or just another character to br printed? Is CR/LF (or just CR, or just LF) used to signal the almost-end of a data packet? If not, then what?

d) Atari SIO data is 10 bits: start bit, 8 data bits LSB first, stop bit. RS232 serial I/O is transmitted the same way, albeit at +/-12V levels. Could I just put a level-shifter (+12V/-12V <-> 5V/0V) between a 19200 Baud RS232 signal and talk directly to the printer?

e) Is a complete list of the 1020 Esc sequences available?

Clues, hints, and suggestions will be appreciated...

Yeah, that's what I had thought, too. That's why it would be nice to
hear from any of the people who ever worked at Analog.

well, i've checked and double checked my connection on the sio2pc cable
and everything is fine. i can load a cassette image into the atari with
no problems. i just can't get the atari to read the harddrive on my pc.
this thing must be in proper working order since it transferrs the
cassette image perfectly so i must be doing something wrong to get the
atari to read the hd. could someone please tell me the steps i must take
to get the atari to read the harddrive?? thanx andy

You can find a program I wrote to make these files or to return them to
normal
executable files on my page at
http://ourworld.compuserve.com/homepages/ken_siders/atari.htm.
They are called MAKEATR and UNMAKATR repectively. They are both Msdos
executables.

For disk drives WRITE(0x57) does a write with verify and PUT(0x50) does a
write
without verify. I would assume a printer would take either.

> b) I'm assuming that the printer ignores DAUX1 and DAUX2. Can anyone
> confirm this?

I think they both should take to 0. I thought somewhere I read different
DAUX1 values
could possible select different "packet" sizes.

Printer "packets" normally always have 40 bytes of data I believe. Don't
forget to get a CR/LF on the printer you will have to send an 0x9B which
is the character atari 8 bits used for end of line.

> d) Atari SIO data is 10 bits: start bit, 8 data bits LSB first, stop bit.

Should work. SIO2PC cables essentially do this.

John Schnittker wrote.
>Obviously, the 400 only has one cartridge, and could occupy 8000-BFFF (16k)
> or A000-BFFF (8k).
The area A000-BFFF is taken first (Left Cart) and the extra 8k takes up the
8000-9FFF (Right Cart in Atari 800)
BTW the hardware is shadowed in RAM at $26F - $2DF (old OS)
but they aren't spaced equally like in the hardware registers.
The new XL/XE has checksums that will coldstart if the Basic Cartridge is
pulled or these locations don't match when RESET is pressed.

Get hold of Mapping the Atari revised edition. :)

Best regards,
WazzdOrf.

You can load an cassette image into your Atari.
What do you mean by that, what setup are you using at that moment?
A 1010 cassette drive, SIO cable and an Atari or what?

Your talking about a Sio2pc cable.
You mean a SIO cable attached at one end to your Atari and on the
other end to the Sio2pc device. And a RS232 cable attached at one end
to the Sio2pc device and on the other end to Comm port 1 on your pc?
Have you set the comm port in Sio2pc right?

Bo.

Very well put. Their tech support was pretty nice, I remember ordering a set of document packages for a variety of topics, smooth scrolling, color artifacting, etc... For free, and they arrived a week later in a manila mailer direct from Atari. The woman on the tech support line was very nice- I can just imagine her thinking "...he should be going out on dates instead..." as she put down my address.

Then there's the thrill of getting one of your programs published in an ACE somewhere; thats what lasts. I still have those ACE issues in a binder somewhere.....

Thanks,

Gregm

>or 143 error.

Usually, the cassette players would die before the tape would. Try a good tape cleaner. The capstan could be deformed, the belt could be slipping. A trick used some time ago was to do a LP.<RET> to affect some registers, then the LOAD C: ... There was also a board that could be built to connect a high qualtity machine instead. Sometimes it can take several tries to get a program to load. If its a commercial tape, try flipping it to the other side to see if another copy is there. Oh, and LIST C: would usually be more reliable than SAVE C:.

ALL,
My question is, do the others (XL-It, Rainbow, A800, etc.) have
anything like the XF Cable to connect a real Atari floppy drive to the
PC? I need this feature.
if any of the othes do support this or better yet a full bi-directional
configuration of this, PLEASE let me know!!!

3640. Atari 400 & Games for Sale -- Ottawa

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-10 00:00:00 UTC
From: bw803@FreeNet.Carleton.CA
Message-ID: <6gjrf9$sv5@freenet-news.carleton.ca>
Source record: 63901

We live in the Ottawa area and have an Atari 400 computer which is
up for sale. Below is a list of equipment and programs. If possible, we
would like to sell all this as a package, so as not to be stuck with any
leftover things which we couldn't use. All items sold as is.
Reply by email with an offer if you're interested.

Hardware:
Atari 400 home computer with cables
Cassette program player
2 joysticks

Cartridges:
Pac-Man (game)
Centipede (game)
Qix (game)
3-D Tic-Tac-Toe (game)
Miner 2049er (game)
Basic (programming language)
Pilot (programming language)

Cassettes include:
(these we bought)
Zeppelin (game -- good one!)
Fort Apocalypse (game -- good one!)
Outlaw/Howitzer (2 games)
Eastern Front 1941 (game)
Clowns and Balloons (game)
Touch Typing (typing program)

(these came as the 80's equivalent of "shareware")
Goldrush (game)
Ski (game)
Chicken (game)
MasterMaze (game)
SpeedDemon (game)

plus some miscellaneous cassettes.

Manuals (thrown in for free) include:
Owner's Manual
Your Atari Computer
Atari Basic
Atari Sound and Graphics
Kids and the Atari

Try un-zipping a small IBM zipped file with it to see if it is indeed a real UN-ZIP program. There are lots of util's for the C64 like Lharc and others that where Bogus Compressors.

3643. MYDOS cart: What were they smoking!!???

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-10 00:00:00 UTC
From: euskara@aol.com
Message-ID: <1998041005160901.BAA08364@ladder03.news.aol.com>
Source record: 63904

Ok, so I ordered the MYDOS cart. It arrives, pull out the docs and behold:
You are supposed to boot the computer with the cartridge on, then pull it in
order for MYDOS to load. Yes, that's pull it as in all the way out while the
computer is on. Now, I am not an expert on hardware, but isn't the purpose
of a cartridge to save your computer memory? Seems to me that a pull out
cartridge is kind of a waste. Also, is it not harmful to the computer to pull
out a cartridge while it's on. I thought you were not supposed to do this!
Anyway, your feedback is appreciated

Both you and the original message said it perfectly- I could not
have said it better. Atari was (is?) my favorite company in the
world! An almost magic company, that thought about the future
the same way I did, and always managed to come out with something
more amazing all the time! What in the world happened to cause
the current Atari situation? The engineers and the programmers
had the Vision, but the various management suits that floated
thru the office had absolutely no Idea. Except for Don Thomas
and Bob Brodie. The Tramiels were completely oblivious.

They probably did this because the cart loads at $8000-$BFFF and dos
is down from $700-$2400 or so. Therefore, you are losing 16k off the
top if you dont pull the cart. It does seem silly, however. Why
didnt they just put a switch on the cart to disable it?

Many carts only use 8K (e.g., BASIC), but that's still more memory
than you want to use for DOS. If I were designing a DOS cart, I would
want to do something clever to disable the cart from software (though
that would make the cart more expensive). Alternatively, I might
include 8K of RAM in the cart and bank select it in after copying DOS
into regular RAM.

Of course, for the most part, I don't see a real need for a DOS cart.
Of course, now I use SIO2PC, so disk space is a non-issue, and it's
quite fast. Also, I wouldn't want to be unable to use BASIC or other
carts at the same time, so I would only be interested in a right
cartridge. But if I didn't have an 800, I would need a cartridge that
would let you plug another cartridge into it. It sounds like that's a
lot of work for only a little benefit.

Now if I were into interesting cartridge hacks, what might be
interesting would be a hack similar to adding a ton of memory, only
have the extra memory be bank selected ROM. Then collect ROM images
from your favorite 100 or so cartridges. Then instead of having BASIC
be the default cartridge, have a cart-select menu be the default.
Then you would have a nice compact game system--no carts or drives to

worry about; just the computer, power supply, monitor cable, and
joysticks.

I have an extra instruction manual for the Atari 8bit game Star Raiders.
The manual is a little crinkled, but there are no tears. Other than
being a little crinkled it is fully intact. I would like to trade this
extra manual for another instruction manual I need. If you have any
extra instruction manuals that you can offer in trade, then please
e-mail me a list. I will consider instruction manual trades for
cartridge games from any of these Classic systems:

Atari 8-bit, 2600, Colecovision,
Commodore 64, VIC-20, TI-99/4a, TRS-80 CoCo

FWIW, I've got an ADAM computer, and in order to copy cart games, I
stick 'em in and pull 'em out with no ill effects all the time. Pretty
standard practice there. But you're right, it's possible to damage some
systems that way.

B&C Computervisions did NOT design the new MyDos cart. It was designed
by Mr. Scam at Video 61. Expect the same thing from the new Sparta
Dos cart which I'm sure they don't have permission to make because
Mike Hohman is nowhere to be found. I'm pretty sure Mike wouldn't risk
showing his face just to make a few dollars from this license.

> BIBI dos (never used that one either)...
>

I liked SuperDOS... for one thing, it was Australian :)

..the coolest thing about it though was that it could read & write at high speed on a US Doubled 1050, and would run a lot more programs (read *games*) than SpartaDOS (the other high speed DOS...)

I had 2.6f, the guy who gave it to me told me it could read & write faster than regular 2.0, but it never seemed faster to me... maybe it was faster on an 810 (which I didn't have back then)... maybe it had to do with sector skew, but I seem to remember that those drives didn't have any way to custom-format a disk.. you said "!" to SIO and that was that... probably that guy was full of bull?

At that same time, I was in Williamsport, PA, not far, about 4 hours drive. My friend and I were gonna go, but as things turned out, we would never have had time, what with the things we were to do that day. (sigh) I met Jennifer and Dave at the next to last Atarifest, not the little one in Indianapolis.

But of course, it was the last, as you said. However, is it possible, somehow, to set up an Atarifest in Cincinnati or some points west, like in Louisville, KY, or Nashville, TN?

But did Toad REALLY drop Atari support? I've gotten reports that they have and have not. Since Best Electronics still has most all the parts you need, I got one question. I have a power supply from them that died. Since I no longer have the receipt, can I still exchange it for a working?

After speaking with Bob Puff about this new Mydos cartridge, He made it perfectly clear that its not good to PULL out a cartridge while the computer is on. All my Atari XL/E are upgraded with massive amounts of RAM and multi-os chip. I would not want to damage - surge or anything else to my system. Why in the WORLD would B&C design such a thing? Bob Puff also stated that it would be EASY to developed Mydos on a CART that would just sit in the machine while on. Im now wondering about the new Sparta dos X33a cart?

The thing that made it faster was that there is a menu option in there that allows you to turn off Write Verify - making the writing faster. But you can do the same thing with regular DOS 2.0, if you know the location and value to POKE - then go into DOS and re-write DOS.SYS to the disk and it would stay like that.

You ordered one too... Should have read my post about it before you
bought it. OK, from DOS format a disk, write DOS.SYS and DUP.SYS to it
and reboot. Now chuck the cart. Haven't used it after the first couple
of times. MyDOS45 now resides on my PC and I use APE to access it.
Isn't there something about a fool and his money...

I've heard here that there are minor differences in the ROMs. I have
not verified this.

The Fight Night cartridge does not work on my 64K 600XL. I don't know
why.

It has a PBI port. I don't think the external RAM expander has a
passthrough for the PBI, so you can't use the PBI on a 600XL expanded
to 64K with the external expander with other PBI devices.

I have used a 600XL expanded to 64K internally with the Black Box.
Worked beautifully.

The composite/split video out can be restored. I have done this. It
is an enormous amount of effort for what you get, but it is nice.

Atari stuff for sale

3 800XLs
6 1050 Disk Drives (1 with Happy Enhancement)
1 1027 Printer
2 410 Cassette Players
1 Atari 1030 modem
1 Atari Touch Tablet
1 Tech Sketch Light Pen
1 Trak Ball
1 Ape Face printer interface
1 MPP 1150 Parallel Printer Interface
1 Monochrome monitor
2 sets of paddles
a number of joysticks

Everything works. Docs for most everything.
Only 1 800XL power supply missing, all others included and working.

Antic Magazines: Jan. '84 - July '88
Analog Magazines: Jan. '85 - June '89
Compute Magazines: Jan. '87 - Dec. '88
SAMS Computer facts for 800XL and 1050

Original Software (Includes Docs!)
On Disk...
Eidelon Ball Blazer
Print Shop Spy vs. Spy
Print Shop Companion Spite & Malice
Print Shop Graphics Library Astro Chase
Castle Wolfenstein Huey
Jupiter Mission 1999 Crown of Gold
Flight Simulator II Karateka
Lode Runner's Rescue Cross Fire
and more..

On Cartridge...
Donkey Kong PacMan
Defender Galaxian
Qix Pitfall
E.T. Phone Home Sky Writer
Robotron 2084 Eastern Front
Joust Star Raiders
Centipede Atari Writer
Droids BASIC

and more...

Plus another 250 or so disks (in 3 disk holders) consisting of
PD software, Analog and Antic disks, and other programs.

I would like to sell this to someone who can pick it up in Columbus
or Cincinnati, OH. I will sell all of the above for $500 or best offer.

3672. Re: SIO2PC yippees

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-11 00:00:00 UTC

Message-ID: <01bd655f$ea1fe820$9ac2accf@asharkis.erols.com>
Source record: 63930

I'm kind of resigned to using the SIO2PC software for transfers from .ATRs to Atari floppies and A. P. E. for everything else. The computer doesn't ever hang, but the other problem is there.

To Vidar:

And no, Vidar, I don't run either program under Windows 95. As I've stated several times and will restate here in more detail:

I have two boot partitions on my hard drive and one or the other is "hidden." They were created
with Partition Magic for just that purpose. When the PC boots up, I can choose to boot one or
the other. When I want to run SIO2PC, or A. P. E., or any number of emulators or DOS-based
games that don't get along with Windows '95, I choose the partition that contains only MS-DOS 6.22. This is not the same as the DOS "7" that came with Windows '95. AFAIK, only Xformer
'98 is designed to work under Windows '95 and that's how I keep it. The problems I see with A. P. E. are either due to peculiarities in my Atari system or to the A. P. E. software itself.

Now back to Fox-1:

Just for comparison, and just for the sake of getting to the bottom of that overrun problem, here's what I have at the Atari end:

130XE with US OS+ and 320K RAM installed by Bob Puff and set to US OS+ mode
(I've tried it in 800 mode with no change)

Quintopus with lines to P: R: connection (printer disabled) and SIO2PC switched

SIO2PC is older Nick Kennedy-constructed model with no diode and two chips

D1: stock XF-551 connected directly to Quintopus

D2: stock 1050 connected directly to Quintopus

D3: stock 1050 daisy-chained to D2:

Wizztronics MidiMax interface daisy-chained to D3:

Xetec Graphics AT printer interface connected directly to Quintopus0

When running SIO2PC or A. P. E., I keep the P: R: switched off and the SIO2PC switched on. At other times, the reverse is true.

What's your equipment list like? Perhaps we can find a common cause for the overrun problem?

Because it takes just a few lines of code to write a program to copy
a block of memory down to another location, using a standard cart board. A
cart on/off system would require some glue logic. Perhaps they dont understand
how to do it, or just want to make a few quick bucks off doing it half way.

Do they even have permission to sell MyDOS? Anyone could slap the binary
version on a cart that needed to be 'ripped out'. Since the source is
available, they should have put the effort into doing it right in any case.

> Bob Puff also
> stated that it would be EASY to developed Mydos on a CART that would just sit

Why 3.3a? Is that the one that uses no ram under the OS? Oh joy, another
disk on a cart.

>>Atari 1020 Color Printer ($15-20) and trade my coding skills, sweat, and
>>soldering gun for the other $100 (may be a losing battle (;-)).
>.....

Ken,

Thanks for the reply. I didn't get back to you immediately because I got
distracted playing with... er, attempting to assess the specifics of the
printer's interface (;-).

Unfortunately, all I've been able to get the printer to do so far is draw
little squares when I power it up. I can't even get the printer to send me
an ACK or NAK response to my command block. This could be because I'n not
doing it properly, or it could be that the printer is not set up to send
an ACK/NAK.

>> a) I'm assuming that WRITE (0x57) is the appropriate command byte to
>> send. Can anyone confirm this? Is there a list of the command bytes
>> that the 1020 responds to?
>
>
>For disk drives WRITE(0x57) does a write with verify and PUT(0x50) does a
>write
>without verify. I would assume a printer would take either.

Thanks. I'll try both (;-). Maybe it responds to WRITE and my code or
hardware is in error. Maybe the 1020 only responds to PUT, and NOT to
WRITE. Or maybe something else... (;-).

It would be nice if this was in the Field
Service Manual, but I suspect it's a bit late to send a nasty letter to
Atari (;-).

>> b) I'm assuming that the printer ignores DAUX1 and DAUX2. Can anyone
>> confirm this?
>
>
>I think they both should take to 0. I thought somewhere I read different
>DAUX1 values could possible select different "packet" sizes.

Hm. I've tried 00/00 with no success, but then, there are so many
variables in this that 00/00 could be valid and it's something else
blocking my attempts.

'Course, one of these fields would be really handy for sending a length
attribute to the printer.

>> c) The data "packet" does not have a length attribute. What terminates
>> it, from the printer's point of view? How does the printer _know_
>> whether a byte represents the trailing checksum or just another
>> character to br printed? Is CR/LF (or just CR, or just LF) used to

>Printer "packets" normally always have 40 bytes of data I believe. Don't
>forget to get a CR/LF on the printer you will have to send an 0x9B which
>is the character atari 8 bits used for end of line.

Hm. Any idea if that would be...

- 40 including EOL(0x9B) and checksum, or
- 40 including EOL(0x9B), plus checksum, or
- 40, plus EOL(0x9B) and checksum?

Some other considerations...

- The printer can be set up to print 20 or 80 characters per line. How
would I print 80 character across if I have to send an EOL at 40?

- If I only want to print 20 characters on a given line, how do I pad
the 40-byte block? 0x00? Space?

It gets even more confusing when I look at the BASIC program in the FSM,
which has code which prints all byte values 0-126 (excluding 27, "Esc")
as a continuous stream (without an EOL) using

? #1;CHR$(X); (e.g. PRINT #1;CHR$(X);)

and sends an end-of-line with

? #1;CHR$(127) (no trailing semicolon = no EOL)

Of course, BASIC _could_ be buffering up the characters, 40 at a time, and
sending when the buffer fills or a PRINT-with-EOL command is executed.

>> d) Atari SIO data is 10 bits: start bit, 8 data bits LSB first, stop bit.
>> RS232 serial I/O is transmitted the same way, albeit at +/-12V
>> levels. Could I just put a level-shifter (+12V/-12V <-> 5V/0V)

>
>Should work. SIO2PC cables essentially do this.

Thanks for the pointer. Looking over the SIO2PC cable pinouts helped me
reduce the number of unknowns in the picture.

Thansk again for your feedback. Any other comments will be greatly appreciated.

3677. 130xe memory upgrade question

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-12 00:00:00 UTC
From: tikk@alt.anonymous.messages
Message-ID: <353102ed.2364548@news.nowhere.net>
Source record: 63738

Hi, question to anyone here. I just picked up a 130XE
that has had a 320K mem upgrade done to it. However
I have no idea as to which one. All the ones that I
have seen on the net are the same and different from
this one. Anybody know anything about this. Here are
the pin assignments. It only uses a 74LS158 and 33 ohm
resistor.

pin 1 of 74LS158 to pin 30 of U17 (GTIA)

pin 2 of 74LS158 to pin 15 of U23 (PIA)
(PIA 15 lifted. No longer goes to pin 18 of U34)

pin 3 of 74LS158 to pin 16 of U23 (PIA)

pin 4 of 74LS158 to 33 ohm to pin 1 of 41256's (U26-U33)

pin 8 and 15 of 74LS158 to ground

pin 16 of 74LS158 to VCC

I guess I can't see how they bank the extra 192k of mem
without the extra MMU.

Thanks..

Hey from what you describel that sound like the 320K upgrade that was done by Scott Peterson. The PIA is what selects the different banks of the memory. I have all the docs for all of his upgrades here at home. If there is something specific you need to know drop me email at dwmoar@teleport.com

Removing a ROM while the computer is on is definitely NOT recommended.. I
have to do sometimes in order to reboot my 256k 800Xl (I guess it is
getting flaky with its old age..)

But I have NEVER heard of any ROM that has instruction to remove the
cart.. that is very weird.. maybe it's an April fool?

Wizard's Crown did not work under Xlit 0.20 nor Xformer 3.6.. I fiddled
with the 800 and XE emulations, basic on and basic off.. still no luck.

has anyone got Wizard's Crown for the 8bit working? (Using an emulator
that is!)

I have heard some talk aboout this game, very rare, great grafx, ONLY 600 ever released, blah blah..

Is this a real game? Does anyone here own it? If yes, what the game about? Plot? Sound/Music? Grafx? Is it even in the same class as say Zybex or Draconus???

DEUCE 98

The Atari Users of North Texas (AUNT) Computer Exposition will be coming again to Dallas this November in conjunction with the monthly DFW XChange Super Saturday activities at the beautiful Dallas Infomart. Show date is planned for Saturday the 14th. As with the last three DEUCE shows, the actual show date will be finalized 120 days prior to the exposition. The exposition, along with the Super Saturday activities, charge no admission fees and are open to the general public. The one day exposition is planned to begin at 8:30 AM and run until 4:00 PM. A Friday evening pre-show get together and a post show get together are also being planned.

November is still a great time to visit the Dallas Metroplex. The DFW Xchange Super Saturday activities are a monthly computer extravaganza where thousands of computer enthusiast get together, share their computer interests and enjoy some of the best computer and high-tech electronic buys in Texas. This November will be special for us Atarians because many of our finest developers and dealers will be participating in the activities.

The Dallas Infomart facility, a replica of the famous 1895 world fair crystal palace, is located in the heart of the Dallas commerce district at 1950 Stemmons Freeway (I-35E). The facility is leased by the DFW Xchange each month to provide a community service to all computer users in the Metroplex area. The Atari Users of North Texas is one of many participating user groups that help support this community service by sharing our Atari computer interests, general computer expertise and providing user assistance to our local Atarians and the interested general public.

Vendors are being lined up. Systems for Tomorrow, chroMagic, Crawly Crypt Corporation, and Emmulators have already expressed their interest in participating in the show. Vendors interested in participating can contact David Acklam at (972) 242-9655 or on-line at d.acklam@genie.com. You can also visit the AUNT home page at http//www.startext.net/homes/aunt.

Alan,

Powerstar is a text/graphics adventure released by Pandora Software.
The graphics are colorful but not fantastic and the game is not too difficult
to play; the parser doesn't seem to be the best around, but it's OK.
It's definitely not in the same category as Draconus, Zybex, Cavernia, Druid or
some other European games, but considering this program was developed in the
States, it's a nice effort (sorry, but I'm having a hard time just finding
three or four good games released in the US in the past ten years...).
There should be a demo version of Powerstar somewhere on the Net.

Take care,
Bertrand.

3689. FST: *LEFTY's* GIANT "U,R,ER" SALE/TRADE LISTING -PART 2

#
**************************************************************************
04/10/98 --> TRADE LISTING *PART-2* - DISKS (800/C64/IBM/etc)<-- 04/10/98
**************************************************************************
#
NOTES ON TRADE/CASH/COMBO OFFERS (PLEASE READ):
===============================================
Hi, I have the following Disk listings for Sale or Trade. My "WANT LIST"
is at the end of these listings. If you wish to buy or trade (or both),
make me an offer. Items have not been priced. I'm really interested in
doing some trading, but unfortunately, I also need a bit of cash right
now, so make your best offer and I'll let you know.
#
Most of the items have not been tested, but everything is guaranteed to
work upon arrival or you will receive a replacement for the same disk
(provided I have an extra one), or choose another one of equal value, or
refund your money and/or trade disk at my expense. I have many references
if your interested.
#
If your buying, send me a reasonable offer that I can live with, and it's
yours. I certainly don't expect to give these disks away, but I also
don't expect an arm and a leg for them, either. Make me your best offer
and I might surprise you. Of course, if I receive two or more offers on
the same item(s), then the higher item will be the one considered.
#
If you are interested in making a trade, please specify which item(s) you
have for trade and which item(s) you would like to trade for or are
interested in. Please be as specific as you can with your trades, since
this will allow me to respond back in a quick and efficient manner. I'm
ready and willing to trade multiple disks for disks in my "WANT LIST".
Again, just make me a reasonable offer and I'll let you know.
#
Cash offers on disk(s) that are "R/ER" will be placed on "HOLD" until all
trade offers for these disks have been looked at (unless, of course,
someone makes me an offer that I can't refuse ;) ). I will notify you
if your offer(s) have been placed on "HOLD". Items placed on "HOLD" will
remain their up to a Maximum of 1-week.
#
I will also entertain cash offers or combo offers (cash + trade), but will
only accept those offers that I feel are reasonable. Of course, the cash
and offer goes both ways. If you feel that an item that I want is worth
more than the item that you want to trade for, then make me a trade offer
and include a reasonable amount that you want for it besides.
#
```

Please DO NOT send me your complete listings of carts to trade (except for Sears carts -See "WANT LIST"). Use my WANT listing and send me offers only. Thank you for your cooperation on this request. All offers will be looked at and responded to, but not necessarily accepted. However, please be patient for any and all responses.
#
Carts in my "MOST WANTED LIST" take preference over carts outside of this list. You will find a wide variety of carts that I'm interested in, but the carts at the beginning of this list are the ones that I am most interested in. Most of the carts I have to trade are in very good condition or better and all work good. If your interested in the condition of a cart, please make sure you ask about it up front.
#
I will do my best to respond to all offers within 2-3 days, depending on the amount of offers that I receive at once. Shipping will be shared amongst myself and the tradee (I ship mine/He or She ships theirs) either by USPS (my preference) or UPS. Overseas trades are welcomed, but my preference will be given to NTSC games and shipping will be either by Ground or Air (depending on the agreement - NOTE: I prefer Air!).
#
Well, that's it. Remember, I may not accept every offer, but I will also not be insulted by any offer that anyone gives. I'm here to trade and sell, just as you are. All that's needed is for us to arrive at a mutual agreement. Just make your offer and see what happens. Thank you for taking the time to read & look through this large, but worthwhile listing.

======================== START MOST WANTED LIST ============================
I am very interested in acquiring the following carts. Carts preceded by
an asterisk (*) will take first preference, followed by NTSC carts, and
finally PAL carts. I expect most of these to be loose, but if they come
with a box and/or instructions, that's fine too. I realize that some of
these carts may be extremely hard to get, but they are the ones that I'm
most interested in. Thank you.
#
ATARI 2600:
```

#
REPLACEMENTS:
=============
I will also trade for these items. I already have all of them, but I'm
basically looking to get better condition carts than what I already have
(near mint or better). Please note that these are very low priority, but
I may be interested in using them as fillers on a trade, if possible.
#
2600: 3-D Tic-Tac-Toe (Atari,Text,Red,'78), Backgammon (Atari,Pict,'86),
Barnstorming (Day Sky), Canyon Bomber (Atari,Pict'78,Black Label),
Canyon Bomber (Atari,Pict,'82,Silver Label), Crossforce, Dodger
Cars, Frostbite, G.I. Joe (Graphic Picture of a Cobra shooting
laser beams), Gunslinger (Sears #99822), Gyruss, Hunt & Score
(Atari,Text), Lost Luggage, Megamania, Challenge of the Nexar,
Oscar's Trash Race, Outer Space (Sears #99803), Pele's Soccer
(Atari,Pict,'86), Plaque Attack, Polaris, Porky's, Pressure Cooker,
Raiders Lost Ark (Upper Case,Cooper Black,Spelled as shown),
Revenge of the BeefSteak Tomatoes, Smurf: RIGC, Snoopy and the
Red Baron, Space Chase (Apollo,Dark Blue Label), and Summer Games.

Also, I collect label variations (priority is low on these, too, except
for Sears carts listed earlier), if you have any strange or hard to find
label variations, send me your list and I'll see if there's anything on it
that might interest me (make sure to give specific label details).

As far as only 600 ever being made, I do not beleive it. If there were
really only 600 in existence then it would be an extremely difficult
find today. But I have seen them offered for sale or trade many times
over the 'Net.

From: rldetlefsen@delphi.com
Message-ID: <p9UKjeO.rldetlefsen@delphi.com>
Source record: 63756

Steven J. Tucker <ai123@FreeNet.Carleton.CA> writes:

>Do they even have permission to sell MyDOS? Anyone could slap the binary
> version on a cart that needed to be 'ripped out'. Since the source is
> available, they should have put the effort into doing it right in any case.

Wordmark Systems@Charles Marslett) put MYDOS into the public domain almost ten
years ago.
As for yanking carts, I have a program for my org 800 that lets you copy carts
to disk. After running the program, you insert the cart into the right slot.
If you don't lock up the computer, you can make a copy of it.
I do agree that with todays knowledge that yanking a cart with power on to run
an app is a terrible protection method.
Rick D.

3696. Re: 130xe memory upgrade question

...
From my archives, this is the 130XE Superram upgrade by Jay Torres. I've used these instructions to upgrade many a 130XE to 320K. Works great. You don't another MMU, just another multiplexer to switch 16K bank lines(I think) into the 192K instead of the 64K that was there.
Rick D.

3697. Re: Hardware interfacing an Atari 1020 printer

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-13 00:00:00 UTC
From: rldetlefsen@delphi.com
Message-ID: <hddJD0E.rldetlefsen@delphi.com>
Source record: 63758

First, the field service manuals will help you FIX the 1020. To create a communication system you need de re Atari and Mapping the Atari.
I have these articles also in my SIO file:Atari Zuchinni-Analog-Apr88 & May88, Atari Zuchinni hdwe-Analog-Jul88. I hope this helps!
Rick D.

As a matter of fact I've got one of the carts right here. Let's
just say it was a primitive attempt at 3d graphics. When I had
a BBS up and running, a demo of this thing made the rounds...
matter of fact, I may still have the demo.....maybe...at any
rate it was nothing to write home to mother about....IMHO...

All,
Seems to me that it should work something like the SDX cart, where the commands are in the cart. Wouldn't this save space? I mean using less of low mem and bank switching the command stuff from the cart. Switching OFF/pullong the cart tells me that this is nothing more than a disk image in ROM. It just loads faster that booting from a floppy. Seems like a waste to me. No useful gain except maybe some disk space and faster boot. This wouldn't seem to help with system resources.

carl & Delinda,
YES! From Happy Waro 6.x up had this feature. However, the PC formatted
disks could only be SSSD or SSDD (up to 180K). You don't find many of
these around. The single side requirement is because the Happy Drive
upgrade was only made for the 810 and 1050 drives. These were single
sided drives. The best you could get was 180K on the 1050.
There is/was also a software solution called (I think) AtariIBM.com
that would let you read PC format disks on a 1050 or XF551. I don't know
how well it worked or even if it did at all.

Carl & Delinda

No, the 600XL was only a 16K machine. You are thinking of the 65XE and
the 800XL. Both had 64K of RAM. However the 800XL has both a PBI and
cart slot while the 65XE had the unified ECI port. The OS of the 65XE
was a slight upgrade. Other than that the 65XE and the 800XL were very
much the same.

Thanks, James. It's great to hear from a supporting programmer. I'll have to look in my back-issues to see if I can find your progs. :-)

Well, that raises even more questions, doesn't it? OK, so we can assume that any program actually written by the Analog staff should be considered public domain, but James is right -- when Analog dissolved, those other games would have reverted to the original copyright holder. Now we have the challenge of finding out all the other programmers' positions on this.

Like I said before, I guess we'll never see a complete archive, huh?

Steven

no, it wasn't a joke.... the grey drive is an XF551, which has all the
goodies already in there. I was considering using the more available
1050 as a starting point. I think you can do 1.44 on the 1050...

A not too elegant way of transferring single atari files to an atr
image is by using PC Xformer. It can
make individual files accessable from dos. Example: load xformer with
mydos in drive 1, a blank atr image in drive 2 and the file you wish to
transfer in drive 3. then simply do a copy d3:*.* d2:*.*.

In <hddJD0E.rldetlefsen@delphi.com>, rldetlefsen@delphi.com writes:
>First, the field service manuals will help you FIX the 1020.

Rick,

Yes... assuming your "fixing" is limited to board replacement or
mechanical adjustments (;-).

> ... To create a
>communication system you need de re Atari and Mapping the Atari.

De Re Atari covers the Atari OS interface to SIO. Unfortunately, it
doesn't go much deeper, and I don't have the OS available to me in my
environment (;-).

However, thank you for making me re-read parts of De Re - it suggests I
might use values of 01/4E for the AUX1 and AUX2 bytes sent to the printer.

>I have these articles also in my SIO file:Atari Zuchinni-Analog-Apr88 & May88,
>Atari Zuchinni hdwe-Analog-Jul88. I hope this helps!

Um... er, sure! Just give me the internet address which will let me link
to your "SIO" file (;-).

I assume you're referring to issues of the old Analog magazine here.
Haven't had any luck locating it on the 'web - there's a pointer to
ftp.clark.net that says it's there, but all I can find there is the
source/object code for a logfile analysis program called "analog".
The directory structure looks a bit odd as well.

Anyway, if those are Analog articles, and you can point me at them, I'd
be most grateful.

Source record: 63778

Found this today. A 1025 Printer new in the box.....I was thinking about keeping it, but depending on what it is worth, I may sell it to someone who'll treat it as well as I would've. Not sure how much to ask for it, so please make reasonable offers. As far as I can tell, it has never been used. It is still packed all up in styrofoam and plastic, includes all dox, and even still has items taped to the print head (so it appears). I didn't open it up, since it has apparently been preserved! :) BTW, I collect classic video game cartridges, and some 8 bit games. If you are interested in trading, send me a list of atari 8 bit carts, 2600 carts, coleco carts, or even handhelds that you might have and want to get rid of.

Thanks,
Brett

From: staalejg <staalejg@ix.netcom.com>
Message-ID: <6gud2j$3ja@sjx-ixn6.ix.netcom.com>
Source record: 63783

I would like to create a DOS 2.5, MyDos 4.53, or SpartaDOS boot diskette for my Atari. Is this possible with APE? I tried doing this by setting up my 1050 Disk Drive as D2: and then booted MyDos (MyCopr) and simply tried to do a Duplicate Disk from D1: to D2. MyCopr sometimes reads all of the sectors from the .ATR Dos image but most of the time will stop reading at the middle point. I seem to have a lot of problems reading from APE when I hook it through my 1050. Any help would be appreciated.

On my original carton stands STAR RAIDERS. (Yes, all in caps.)

I seem to remember finding a PC programme that would enable you to
read/write Atari 8-bit format disks in your PC's 5.25 disk drive.
I can't seem to remember where I read this.
Does anyone know of such a programme?

Thanks,
Christian Fowler

I have a 'star raiders' cart. Haven't seen 'star raider.' If you want
to check for differences, read the ROMs and do a checksum or CRC of
them.

Try SpartaDOS 3.2g, or SpartaDOS-X 4.22. If SDX 4.22 doesn't see it,
please let me know, and I'll investigate further.

Howdy folks

You'll have to do the configuration yourself. Choose option O from the MyDOS
menu. After a couple a questions about other stuff, you'll be asked about the
presents and after that the size of the RAMdisk. Then it asks for standard
configuration. If answering "Y" won't help, you'll have to enter the bank
sequence by hand. It uses pins 2, 3, 4 and 5, I guess that means 4 + 8 + 16
+ 32 gets added top some value somewhere. I haven't really taken the time
to figure this sequence thing out, but I'll probably have to soon. I wanna
install a SIMM upgrade in my 65 and 800 XE (both "new design" motherboard, read:
only two 64 by 4 RAMchips inside.

Mathy,
I'm only be hard on the guy that decided to put MyDOS on cart this way.
Lance had no way of knowing and I guess someone had to be the first to
try it out. I've never been much for MyDOS, myself. However, since it
has such a huge following, I had hoped that this would have been a much
better effort. I generally use SpartaDOS (disk and cart) for most of my
stuff. I have most of the other DOSes too just for the sake of having
them and in case it's necessary for some reason or other.
Bill seems to be heavy into X-windows game programming lately. However,
he certainly is one of the ones that could probably accomplish this,
properly!

I'm a MyDOS man myself. Didn't know that there was a huge following. I just know
Bob Puff, Bob Woolley and Bill Kendrick (and me) don't want anything else.

I do have Sparta, but only use it when I need to.

Man, I'd REALLY love a good MyDOS cart.

Speaking of cart. I dug up my Analog issues (45 till end) and found an ad
by Canoe. They sold cartridges that were supposed to be memory upgrades.
Up to 1 MB. Anybody ever see those???? And MAgna Systems said they also
had XL/XE memory upgrades (underneath their AXLON compatible 800 memory upgrades)

Anybody ever seen those???

Ok, i'm gonna tell you how i make myutil works:

1. Only use 360k disks never use HD those don't work in transfers.
2. Format the disk in the PC using 360k mode.
3. Use Util or Myutil to re-format the disk in Atari mode.
4. Made the transfer usin the options W to write and B for binary transfer.

I've been doing this without loose a disk for the last year, using an XF551,
never tried in other drive. Hope it helps. BTW Util and Myutil can be found
in the UMICH Atari archive, you can check the FAQ for the URL.

Alan,

Steve what-his-name has a Powerstar cartridge for sale/trade at
http://bbs.prowlers.net/stever/INDEX.HTM in the Atari section.
There's no price though - he wants offers.

I have dealt with him in the past and have had no problems, but some
of his boxed cartridges are a bit expensive when compared to B&C or
Bravo-Sierra.

I'd be interested to know how much a Powerstar cartridge would go for,
and if anyone knows where to buy Airball for the 8-bit - let me know.

Thanks

Graham.

Airball is one of my favourites! The music is excellent and the gameplay
lasts for hours (years in my case ;-)). I don't think you'll be able to
get this game on the net.
I think it was only released on ROM cartridge. I have a copy on ROM, but
I'm afraid I don't want to sell it.
However, I have seen it on the net for the Atari ST emulators. You can find
it in the games archive at Little Green Desktop. I think the URL is:
http://www.fatal-design.com/desktop/
Go to the Games Archive and search for Airball. I think it's on Automation
disk #4.
You'll also need the PacifiST Atari ST emulator for your PC. You'll find
all the information you need on PacifiST etc. + TOS ROM images at Little
Green Desktop.
Get TOS v1.62. Most games work with that version.
Believe me, it's worth the try!

Christian Fowler.

You know, I've been trying to solve this problem for years. Stephen Tucker couldn't figure it out. I can do that kind of duplicating using SIO2PC software but not A.P.E. Only one other guy in this newsgroup has had the problem and I'm waiting for him to write a message with his equipment list so that we can compare notes. It might also help if you posted your equipment list.

There are guys here who will tell you that you have the problem because you're trying to run A.P.E. under Windows 95. Guess what. I don't do that. I run it under MS-DOS 6.22 and I still have the problem. Also -- changing settings in A.P.E. doesn't help, and neither does using a different copier. Even the Atari DOS 2.5 "J" option gives the same results.

I've gone over my equipment, eliminating or changing everything except the serial cable to no avail.

It bugs me. A.P.E. is a great program except for that one problem, which many others say they don't have.

I hope we can work a solution out together.

Source record: 63810

Exactly. I would rather concentrate on getting SDX 4.22!
I don't even use MYDOS (although it seem I may have to set up
a MYDOS partition on the HD to run the stuff that either SDX or
3.2g refuse to run. Didn't someone say that ICD has some 8-bit
stuff listed on their homepage? Would be cool if the rights to
Sparta reveterted back to them after FTE disappeared...
Last thing I got from Hohman was an SDX 4.21 ROM, but
supposedly I need a new cartridge board, as the ROM doesn't
like my cartridge board in my SDX cart. It locked up all the
time, so I went back to 4.20. sigh...

I did this and there is no difference in the programs. Star Raider
seems to be the rarer (if you want to use that word) of the two.
No idea why the difference though. Maybe an early printing mistake...

3753. Atari Deflector Cart

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-14 00:00:00 UTC
From: tikk@alt.anonymous.messages
Message-ID: <3533ddd9.4864160@news.nowhere.net>
Source record: 63814

I picked up a XL/XE only cart called Deflector (c) ATARI. The EPROM inside says "DEFLECTOR PROTOTYPE". When you boot the cart it says "Deflector" in a gruff voice then goes into some neat music. Question, how rare is this cart if at all and does anybody have any docs on it. I have no Idea how to play it. Oh, it has a green paper label taped to the cart case.

Thanks..

3754. Modern modems and 600XL

Newsgroup: comp.sys.atari.8bit

I have SDX 4.20 but am not sure how to set up a ram disk with it.
I did get RD.COM from SD3.2X to see it.

Is SDX 4.22 a cart? What features does it have that 4.20 doesn't?

Anyway, I may just redo it the act like Scott's but got to fix my
ATR8500 first.

Later and thanks..

I agree. I got my update of Xformer 98 recently. Here's what I'm seeing:
- Runs very slow on my P 233 with 64 MB RAM and Stealth Video
- Sound is very choppy
I'm using DirectX 5.0 like what is recommended but for now I'll also stick
the XL-it. Just wish XL-it could support the Xformer cable....

As to ANALOG being dissolved, the complexity here is that ANALOG was
owned by two different entities. When LFP bought the magazine I do not
recall if they got all the rights to past published works, or if those
rights were released back to the authors. I know in my own case when
ST Log folded I wrote to LFP and requested all my old articles be
officially released to me, and I got a letter from them agreeing.

OK, guys, here is my little contribution to the subject:

I've own Ataris for mor than 10 years, it is IMHO one of the best designed computer systems of all times, but, as time goes by so computers, i don't own PC's, but i work with them all day long, the main reason i don't wanna buy a PC is the tech groundbreak, i've been thinking buying one just because i want APE for my Atari, anyhow, i don't think Hasbro or anyone will take the A8 out of the basquet, the many out there who own one of the newer game consoles know exactly why, in the meantime we are seeing a resurrection of old 8-bit tiltes, the last one, i think, is robotron for the N64.... So, games we will see lots of resurrections, systems, i don't think we'll see any.... Still, i buy any piece of A8 hardware that crosses my path.

Javier.

If you decide to 'go PC', I suggest trying Linux or
FreeBSD first. They, as unixen, tend to be a bit
harsher on newcomers but, they're much more reliable
than WinXX and perform better (more responsive) on
similar hardware. You will likely be quite shocked
with how much computing horsepower it takes to just
do basic computing with WinXX.

>The picture quality with alternate cable is poor...

On the original 800, that was built-in. The cable was wrapped around
a metal ring before it left the case. I suspect that did something to
cut out interferrence.

If your TV has RCA inputs, your best bet is to make a monitor cable
and bypass the channel 2/3 stuff (unless you have a 600XL). I made
such a cable a few weeks ago--I've never seen clearer graphics from my
800.

I think you may have to use an actual joystick or gamepad to get this to
work correctly. I found Bruce Lee works with Atari800Win much better
(although the keyboard controls are rather clumsy). You can find it at
http://www.concentric.net/~Twist/atari800win/

The Magic Box (not really magic), hides a magnet which is in about a 2 inch circle maybe less. Find one of these and wrap your cord through it about 4 times and you have what Atari put out as a video cable.

The little ring was a ferrite core used to de-couple the RF generated
by the computer from the outside world. It was done as part of the FCC
type acceptance and to present a nice 75 ohm load to the switch box
that had a nice little balum which converted the 75 ohm impedance to a
300 ohm impedance that most TV's like.

>>Frank McKenney wrote in message <352d129c.0@news3.ibm.net>...
>>>
>>>I needed a small and reasonably-priced printer for a home data-logging
>>>project. The nice RS232 printers start at $130, so I'm trying to use an
>>>Atari 1020 Color Printer ($15-20) and trade my coding skills, sweat, and
>>>soldering gun for the other $100 (may be a losing battle (;-)).
>>.....

Progress Has Been Made. The printer now prints my (very unoriginal) line
of 39 "A"s and a CRLF (0x9B).

What finally got me over the last hurdle (so far (;-)) was discovering my
old copy of the "Atari Personal Computer System Operating System User's
Manual and Hardware Manual", November 1980. This book has detailed specs
on the SIO bus, including...
...
...
...
(wait for it! (;-)) ...
...
...
...
... TIMING DIAGRAMS for the SIO bus!

Yes, I was driving old NMOS chips (6805/4 MHz) with a 10 MHz PIC16F84, and
just running too fast for the printer to keep up.

Here's an outline of my revised code:

1) Send the command frame.
- Bring /CMD low ("This is a command frame coming").
- Wait 750-1600 usec.
- Send the 5-byte command frame:
0x40 (Printer device ID)
0x57 (Write)
0x4E (AUX1 - probably ignored)
0x01 (AUX2 - probably ignored)
0xE6 (checksum)
- Wait 650-950 usec.
- Bring /CMD high (End of command sequence).
- Wait 0-16000 usec for ACK/NAK of command frame
2) Send the data frame

- Wait 1000-1800 usec
- Send data frame + checksum (41 bytes)
39 repeats of "A"
0x9B (EOL)
0x8C (Checksum)
- Wait 850-16000 usec for ACK to data frame
3) Wait for completion of command
- Wait 250-250E6 usec for "complete"

And it prints!

It's not completely clean... The ACKs I get back are 0xA1, 0xA1, and 0xA3 instead of 0x41, 0x41, and 0x43 (ACK/ACK/Complete). And I need to do more testing to make sure I can send text other than capital As (;-).

But I'm close.

I'd like to express my appreciation to Ken, Rick, and those maintaining the various Atari 'web sites around the world. I couldn't have done it without you guys.

Howdy folks

Re: no ECI on American 65XE's.

Has anyone ever looked at the motherboard of the American 65XE?
Does it really differ from the 130XE's or did they just not solder in
the ECI connector?

As you might know the 65XE's that were sold in Europe (mainly Poland) all
have the "new design" motherboard. With space for FOUR 64 by 4 RAMchips. But
only two of those are filled. It DOES have the ECI. And a fermer keyboard,
and a faster and improved selftest. It'll test 128 kB if it finds that much.
But they threw the function key stuff out of the OS (so you cannnot add the
F1-F4 the 1200XL had anymore.

Would be nice, if the American 65XE's could be upgraded by soldering in the new
connector. And since you'll have to contact Best Electronics anyway, you can
order the bottom case halve of the 130XE at the same time. :-)

tikk,
Besides the CAR: files, many of the .COM files for 3.2D work. The
SpartaDOS Tool Kit has a few programs on it that are not part of SDX.
There are loads of nice utilities available oat varoius web/FTP sites.
If you are looking for something special that you can't seem to find,
e-mail me. I just might have what you are looking for.

Howdy folks

Sorry folks, I made a HUGE mistake which I only discovered while the computer was busy posting it. Please do not read the file named "RE. MYDOS (BOOT SECTORS). I wanted to MAIL it, I posted it. Sorry. I still don't have a clue about how the PC's work and they also changed the system YESTERDAY.

SORRY.

Al,
I haven't tried this, as my A.P.E. cable seems to only work in one

direction, at the moment. But... Form what I understand, you can boot the Atari with A.P.E. and a bootable .ATR image (I Think). If this boot image also includes Discomm and a second image includes a DCM'd boot disk file, couldn't you unDCM the boot file to the floppy? You may not be able to duplicate a disk, but DCM should work. Let me know if this is possible.

I am running Windows 95 on a 486DX-66 and it runs decently. Seems almost as responsive as my Macintosh at work (7200/75). I run Microsoft Office products and have never had a complaint about performance.

I would like to try Linux but it does seem intimidating. Also, where does one get software for it (like word processing, graphic)? This is an honest question.

NO, i have 2 North American 65xe and the layout is different from the 130XE,
no much room inside no ECI port..... But, i'll look at them tonight, just in
case.... let me think, a little long ago i bought what i tought was a 130XE
because has the ECI port, the case says 65XE, maybe this is what you are
looking for, i tought for a long time this was a crippled 130...

I bought my SDX 4.22 chip direct from Fine Tooned Engineering/Mike Hohman
about Dec 1995. Which was just before he made himself disappear.

Unless you manage to find someone who's willing to sell, I think they're
rather scarce.

There's a free (not for profit) office suite called Star Office
available for Linux. I've got it, I use it very occasionally. I end up
using Word 97 more often because I don't get the same quality print in
Linux that I do in Windows. I'm using a Canon BJ-200ex. Printing in
Linux is primarily done with postscript, so if you have a postscript
printer you should have no problem. I, on the other hand, don't so I
have to use a postscript filter (apsfilter) to make it work with my
printer...and then I have to use a BJ-200e driver (which is half the
resolution).

StarOffice is not bad. It supports conversion of various format
documents (albeit, not Word 97, but will do Word 6.0). It has everything
you'd expect in a word processor. I especially like having the
mathematical formula editor...which comes with the package.

3806. Bounty Bob Question

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-16 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <1998041615441800.LAA23917@ladder03.news.aol.com>
Source record: 63867

I've played and loved both Miner 2049er (which I still have and play) and Bounty Bob Strikes Back (unfortunately I have lost that cartridge and would love to find another one).

At the time that Bounty Bob was released, advertisements for another Big Five game began appearing: Scraper Caper staring Bounty Bob. In it, Bob appeared to be a fire fighter who had to deal with putting out fires in sky-scrapers The game was supposed to be for the Atari 8bits, Commodore 64, and Colecovision. But I never saw the game itself.

Does anyone know if Scraper Caper was ever released for any system?

Thanks in advance!

Man, you've just jarred a long, lost memory in my brain! I vaguely remember this game's title, but I'm not so sure if it had Bounty Bob in it, or if it was released. Now I want to know the answer to this as well, or I'll go crazy! (Sorry if I got your hopes up by posting this response...you probably thought it was an answer, right?)

Go to www.cheapbytes.com and get the newest redhat cd, plus a couple
of the linux archive cd's for under $10 total. Should be everything
you need and then some :)

Ouch! 95+Office+486?

>
>I would like to try Linux but it does seem intimidating. Also, where does
>one get software for it (like word processing, graphic)? This is an
>honest question.

The major linux vendors distribute it (like Redhat or Caldera)
and you can find it in places like *linuxmall*. For games that
have been 'un'released, you can just pick up the game at CompUsa
and download the Linux version of the executable (QII, UO).

There's also a 'freeware' ST emulator called STonX that
you might want to try out. You'll have to provide ROM
images however (not hard to find on the web).

Linux will likely run more responsively on the hardware
you're using now. Although, unless you have lots of ram,
I would not expect much out of either '95 or linux.
Although Linux is a lot easier to trim and tune.

I never found the performance of M$ OSes to my liking.
I also found the registry and plug-n-pray quite annoying
as well.

Atari dealers are taking reservations on a
Linux 2.x CD-ROM, rumored to be available
Real Soon Now.

>But I never saw the game itself.

>Does anyone know if Scraper Caper was ever released for any system?

I posted this same question about a year ago. No
one was able to recall it ever being released. I've
never even seen screen shots of it. If it was indeed
released, it may have been on the Colecovision (but there
are no ROM images available to the best of my knowledge).

If you do find it, PLEASE let all of us know.

Sorry about using Dejanews guys... I'm getting a 440 with my server

I'm looking to trade a Complete MAC SE System for 8 bit stuff... I am
looking for 1050's, printers, 130 XE's and anything else for that matter!

The SE has the following...

20 Meg HDD
800k 3.5 Floppy
(probably an external 800k floppy to if I can weasel it from someone)
4 megs of ram
System 7
a bunch of software
other stuff

I'll get into More detail once I get a reply...

Thanks a mil

Eagle will be nice and all. However, most Atari's
still floating around now are still limited to 4M
which for GEM is nice but for Unix even in curses
mode, it's a bit cramped. That's just the RAM,
mind you, and not even getting into storage...

There's some sort of key combination or command in the Scott Addams text adventures for the Atari 8-bit that switches the text display from the difficult-to-read cursive font to the standard Atari character set. Unfortunately, I've long since forgotten it. Anyone here remember?

Thanks...

Honestly, it runs along at a nice pace! Keep in mind, I;ve used high-end Power Macs, Suns, Pentium IIs and while it can't compare to those systems, it runs nicely. Especially for simple tasks like Microsoft Office. I do have 28 megs of RAM but even under 16 it wasn't bad.

> The major linux vendors distribute it (like Redhat or Caldera)
> and you can find it in places like *linuxmall*. For games that

I have seen Redhat at Electronics Boutique. The problem I might have with Linux is that I only have a 500 meg hard drive.... Are these commercial versions easy-to setup as, say, other major OSes? Like a nice setup program?

>
> There's also a 'freeware' ST emulator called STonX that

I have heard good things about it. Does it allow different resolutions other than the three standard ST ones?

>

If by trimming and tuning I have to wade through tons of configuration files, I am not sure I want to. Are many packages for Linux "complete" or do you have to compile most packages yourself? Sorry I am so clueless on Unix.

>
> I never found the performance of M$ OSes to my liking.

> as well.

The registry is fairly easy to configure, IMHO. Also, for some odd reason (I know I am in the minority), Plug-n-Play has worked flawlessly for me. Windows detected all of my components and I had no conflicts. Strange ;-)

Thanks for all the responses and help!

James,

Thanks for letting me know I'm not the only one with this problem. The printer/plotter mechanism for the Atari 1020 is (I believe) the same one used in the Tandy/Radio Shack CGP series and the Commodore 1520(?), and was made by a company named ALPS. I'm about to send an e-mail message to ALPS' technical support group to see if anyone there remembers the thing.

Hey, it couldn't hurt... (;-)

> ... For $15, you should be able to
>pick up a regular, old timey, 9-pin printer, with

>here will provide you with some kind of printer interface.
>(APE (not APE by S. Tucker), U-Print, Grapix, seems
>like there were a bunch of them.)

Actually, I already have a DEC '50, 80 columns, 8.5x11, serial interface. Ideal from _my_ point of view. Unfortunately, the "customer" (my father) thinks the DEC, plus the paper stack, will take up much too much space.

I'm building a low-use data logger, and what I _really_ need is an inexpensive (under $40) and small-footprint printer (preferably with a serial interface). These are manufactured as "POS printers" and "receipt printers" (used to be called "panel printers"), but new ones start at $300 and go 'WAY up, and the lowest I've seen a used one for is $150. Which is why I'm bludgeoning myself with the $15-by-mail-order Atari 1020.

Anyone know where cash registers go to die? Is there some "NCR graveyard" somewhere in Africa, perhaps? (;-)

Run 'nicely' is not something I would describe of
any version of Windows. They're far too bloated
for too little actual functionality. Until I switched
to Linux, I was constantly contemplating an ST
emulator so that I could run more efficient (yet
useful) applications.

That fixation is gone. (although STonX is still
kinda nifty)

Yup. Hardware configuration is more Win 3.1ish. There is
some plug-n-pray but that's primarily with PCI devices.
Whether or not this is a good thing tends to correlate
to one's Win95 experiences (good or bad). For LInux,
500 may be a bit tight. I would expect it to be tight
for Win95 as well. If you dont have any intention of
using the linux dev tools are some of the more hardcore
unix utilities (like tex) you should be fine.

Yes, but it only runs in 256 color mode.

Yes, there is configuration overhead. Unix is a system
where you boss around the OS, instead of vice-versa.

Win95 did detect my 2nd CDROM drive, my tape drive & still
doesn't have a proper driver for it, didn't have a useful
monitor type for my monitor & misconfigured my ethernet
card disabling my modem in the process. Yes YMMV.

The registry is too prone to corruption & not a help to me
as I would be directly modifying it anyways to bend the
machine to suit me.

You might want to try a hobby shop, especially the ones that
specialize in model trains and model cars. I had the same
thing happen to mine, and have never gotten around to getting
it fixed. Be sure to take the gear with you so it can be matched
up.

hi Bill!

Seems like this game is a bit of a mystery. Everyone that has replied to me either wants a copy, knows where I can buy one, but knows VERY little about the game in terms of sound, grafx, game play and comparison to 8bit gems like Zybex or Draconus.. gr.5 or gr.7 doesnt sound like 'hot' grafx.. and I dont understand what you mean by "seeing in 4 direction at any location".. a little vague don't you think?

Thanks for your response though!

3829. ST Mouse, Flash 8, Mouse OS

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-17 00:00:00 UTC
From: NOSPAMronwizbot@juno.com
Message-ID: <3537cbf2.113307730@news.ou.edu>
Source record: 63697

Hello,

Just a point of interest for newcomers:
An Atari ST Mouse will work with an Atari 130XE, 800XL,or any Atari 8bit, please visit:

http://aegis.mcs.kent.edu/~clisowsk/8bit/controller.html

There they talk about the STM1, the first Atari ST Mouse, as being an inverted Trackball. If a Mouse is an Atari STM1 or compatible ST Mouse, then it should work without modification like a Trackball on a 130 XE.

Does anyone have Freeware or Shareware MOUSE driven programs for an 8bit Atari? Do you know where I can download some?

--- Unrealted issues
Has anyone considered a CPU upgrade, like the Commodore 64 Flash 8? The FLASH 8 is a GEOS-compatible module for the Commodore expansionport with a 65816 CPU that speeds the C64 to 8Mhz by highest compatibility with existing software.? I wonder if that upgrade can be modified to work with an Atari 8bit machine? Someone with an Extra Atari and a Flash 8 may be willing to experiment with this modified configuration... sorry, I don't have those resources.

Also, what was the Mouse driven Operating System from Germany? Is it still available?

Ron

This an EXTREMELY common problem for 1020 printers. Replacement gears are available from Best Electronics in California USA 408-243-6950. A set of two is $6 but they have a minimum order of $20.

It's possible to repair the gears. Remove the gear from the motor shaft and tie a string snugly around it to close up the gap that has broken between two teeth. Secure it carefully and run a 1/16 inch drill bit through the center hole. This will remove a small amount of plastic so the gear will slide over the motor shaft without making a gap where it is broken. Roughen the motor shaft if possible with fine sandpaper and clean it with alcohol (don't get alcohol in the bearing). Apply a layer of epoxy glue inside the gear hole with a toothpick and on the end of the motor shaft. Slide the gear onto the shaft where it originally was. When the epoxy cures, cut off the string and reassemble. The printer should work normally.

Steve

Thanks, I seemed to have found just about everything I need. I reread
the SDX manual from cover to cover and figured out all the commands
and settings. I then downloaded everything I could find on SD / SDX.
Now I just have to sort through everything. I even found a copy of the
SpartaDos construction kit 1.1/3.2b I forgot I had. It was still in
the shrink wrap. I bought it and never used it. Oh well, now all I
have to do is figure how to stuff SDX inside a XL or XE. Should be
fun.

Thanks..

If the left hand don't get ya, the right one...

I've just discovered that the paper feed problems on my two 1020 printers
is _not_ a result of my ignorantly mis-feeding the paper, or because the
rollers are old and worn.

Both printers have the same broken gear, the little one attached to the
Paper Feed motor. As the motor turns, the "idle" gear teeth hit the
slightly-larger-than-normal gap and jam. Frequently, but not always (;-).

Anyone know any sources for a 0.125" diameter nylon gear with a
slightly-under-.0625" hole and... 13 (yes, thirteen) teeth?

Sigh...

(Mentions 1020s with bad nylon gear.)
Yes. I got some of those 10-15-20 dollar wonders. They all busted that gear. I still have some with that busted gear. I don't know why, but older 1020s didn't do that, I think. The paper has to be exact, the pens have to be exact. It is a tough printer/plotter, but I had fun with it for a while. For $15, you should be able to pick up a regular, old timey, 9-pin printer, with centronics port. Then, for $7 plus $3.50 ship, someone here will provide you with some kind of printer interface. (APE (not APE by S. Tucker), U-Print, Grapix, seems like there were a bunch of them.) I have a 16k buffer printer interface (no, 64k buffer), it is a U-print. The designers got messed up tho, and made ALL 155s come thru as 13,10, so you couldn't make it do any graphics printing.
I ramble.

3835. Why Buy Atari from Bravo Sierra?

Hi, I'm Ben Smith of Bravo Sierra Computers. It's called Bravo Sierra
because that's my initials. Not because I do business that way. Buyer
Beware. You can buy from a Private Party, selling out their Atari. But
where will they be when you need help. You can find bargains at a Flea
Market. Still, you get what you pay for. You can shop at a garage sale.
But where will you go when you need help. Certainly not to those fair
weather fiends. Come let me fill your Atari needs. I've been an Atarian
since 1982. I've been in my Atari Club as a Teacher of New Users, News
Letter Editor, BBS SySop, Promoter of my Club and Vice-President of my
Atari Club. So go ahead and ask your questions. And Remember, If you
can't come see me Today, Come see me Tomorrow.

FREE Catalogs for your Classic Atari 8 Bit or Atari ST Computers!
HardWare, SoftWare, Books & Accessories! I do my best to test my Atari
stock before adding it to my Catalogs. Weeding out defective stock.
View Catalogs at: http://www.teleport.com/~bensmith/bscomputers.shtml

Just wondering...

Anyone out there a SpartaDOS fan.... use an XEP80 (or other 80 col
method).... and use a program called either WDIR.COM or DIRW.COM?

Jon

I usually pick these up at a business liquidation sale for under $20.00
Most any business liquidation will work, even restaurant's and the like.
Also, you can ask at the local thrift stores. In my area, they sometimes
have a LOT of stuff that they don't know what to do with, this is frequently
one of those items.

I haven't personally installed Redhat before, but I've heard it's a good
installation. 500 meg should be plenty (I used to use Slackware and
XFree86 on a 500 meg drive and I still had room to spare).
>
> If by trimming and tuning I have to wade through tons of configuration

As an end-user I had to reconfigure the kernal to support my hardware,
and if I wanted to connect to the internet, I had to write my own script
to connect to my provider and start the pppd daemon. There are books
that explain this, but they aren't terribly clear. Also configuring
XFree86 (the Xwindows) can be a real pain in the butt. Other than that,
that was about it. :)

I have two carts, and both are Star Raider. One was purchased new in 1980. I don't know when the other one was bought. Perhaps it just has something to do with when the carts were made.

Paul

3844. Problem: PC Disk Drive R/W atari disks.

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-18 00:00:00 UTC
From: ae922@sfn.saskatoon.sk.ca
Message-ID: <6hb2r8uuj1@missing.its.to>
Source record: 63706

hello.. sorry bout the cryptic subject line. couldnt think of a better
way to word it..

ALRIGHT.. heres my problem! :)

i have downloaded a billion (well 3 or so) utilities for creating disks
that should be able to be read in my atari disk drive for my PC...

I have tried formatting disks with every one of em... and none of them
can be ready by my atari. All the utilities (except sdatari which i'll
get to in a moment), can be read by the programs that made the disk. And
I can copy files to the disks (in fact I did do just that; copied a bunch
of files to a disk.. it wouldnt read) in the PC... but they cant be
accessed on my atari.

I really don't know whats up. I thought it might be my PC disk drive.. so
i got my old DD 5.25" from my old machine and plugged it in, same problem.

Its not my atari disk drive; i have 2 of them and unless both drives are
affected by the same problem.. it isnt them.

ok.. to sdatari.. i try to format a disk with it.. it formats then gives
me a short list of errors when it tries to read the disk right after the
format; then it cancels reading.

can anyone help me here? tell me whats wrong?

thank you!

3845. Atari800 emulator fork?

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-18 00:00:00 UTC
From: "Robert W. Brewer" <rbrewer+usenet@op.net>
Message-ID: <m3yax2lh43.fsf@monet.op.net>
Source record: 63707

I just discovered that there appears to be at least 2
different branches of development on the Atari800 emulator.
There's the original at David Firth's site (version 0.8.6,
http://www.signus.demon.co.uk/david/atari/atari.html) and
one at Thor's site (version 0.9.2,
http://www.math.tu-berlin.de/~thor/thor/index.html).

Are both these being actively developed? Looking at the
CHANGES files, they each seem to have new features and bug
fixes the other lacks. It appears they diverged at version
0.8.1.

Is there anything being done to merge these together, and
possibly merge the Atari800win changes too? I'm a Linux
user actually, but having One Common Source Base would allow
everyone to benefit from fixes and additions.

Any thoughts?

Since there is currently no newsgroup for the Atari 7800, I thought I would share this with the great folks on the CSA.8bit newsgroup.

I just purchased (over the Internet) a mint-in-box version of Asteroids for the Atari 7800. I played it, and... it is really good! The asteroids rotate as they fly at your ship, and they appear 3-D-ish and colorful. The game features simultaneous play for two, team or competitive.

On the downside: the playfield feels small. The asteroids do not loom. In the arcade Asteroids the asteroids would really loom. In this game they seem kind of smallish. They still blow up into 2 then 4 parts, but this game could really have used some looming asteroids.

Thanks!

vs

PS: I wish the asteroids would loom more.

3847. Re: Atari800 emulator fork?

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-18 00:00:00 UTC

Source record: 63709

To clear the Atari800 mess:

The "official" Atari 800 is at 0.9.2 (source is at 0.9.3 Alpha) - it is being developed by a couple of people. The most updated DOS version is available at:

http://cas3.zlin.vutbr.cz/~stehlik/www/a800dos.zip

The windows port of Atari 800 has its own home page at:

http://www.concentric.net/~Twist/atari800win/

The version by Thor (named 0.9.2) is missing a lot of the features of the official 0.9.2 and is - as far as I know - not being continued. The main Atari 800 team is looking at Thor´s code and will implement the useful changes into the official version.

The current 0.9.2 is by now the by far best Atari 8-bit emu. It is far better and faster than XL-it - examples for the high compatibility are the PERFECT Lucasfilm Games titles and The extremely advanced Pokey emulation (2.4 by Ron Fries).

Atari 800 is on the best way to be the first 100% 8-Bit emu...

Cheers,

Julian

3848. Re: Atari JAG-MODEMS Available NOW !!!

Source record: 63710

Nope,

Not only do they work, but they work quite well. Also included are the latest Labtec Headsets which sound superb!!! The only downside is that Ultra Vortex is the only game that can use the modems, but its a great game to play over the phone!!!

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Yeah. And all generalizations are false.

> >Im sick of seeing there awefull PORNO messages on this user group, It
time
> >for us to stand together and SPAM them to HELL,

For one, you'd never catch them. Those people don't stay at any one
address for very long.

For another, they might not even know that they've put an ad here. They
set their software to get into all the newsgroups and walk away.

For a third, and probably most important, it's not worth the expenditure of
time, energy and emotion to go after them. Ignore them, as I do. You'll
be happier.

The 65XE did/does not have a PBI port. Somewhere a long time ago I did an upgrade for a friend on a 130XE that let you install the 1200XL F buttons with the use of momentary switches. I am sure this would work on a 65XE if one wanted it. I am in the process of cleaning out my files and when I come across this documentation can scan it and make it available to those that have a need? Still have the 130XE with the switches instaled here somewhere, got it back in a trade, so if I don't find the upgrade docs can produce the docs from the 130XE.

I was under the impression that the latest version is still 0.8.6,
released on 21 Feb 1998 by David Firth. It is available at:
http://www.signus.demon.co.uk/david/atari/atari.html

I was under the impression that this was David's emulator, and hence,
I would expect his web page to contain the "official" version. Or has
he turned over development to someone else?

>The most updated DOS version is

You mention DOS and Windows, but where do I find the source for
building the Linux or Amiga versions?

>The version by Thor (named 0.9.2) is missing a lot of the features of
>the official 0.9.2 and is - as far as I know - not being continued. The
>main Atari 800 team is looking at Thor=B4s code and will implement the
>useful changes into the official version.

Yeah, I looked at Thor's code, too. It didn't work under Linux, and
he was "nice" enough to reformat the code to fit his coding style,
making it a pain to compare it with other versions.

>The current 0.9.2 is by now the by far best Atari 8-bit emu. It is far

Had the same problem, in my case I was able to use the atari drive to
format the disk and then all worked ok, was able to read/write atari
format disks on atari or pc with that disk. I say ok cause thats the
best it ever worked for me. Maybe someone could write an atari file
system driver for the pc. Just a hopeful thought.

Yep, wide directory with pausing and strips some of the file info out
to fit more on screen. Works with 40 column as well.

I have an Atari 5200 system that works. It is a 4 port version and I am told a few models that has an * in the serial number can support the Atari 2600 adaptor. Since I haven't seen one like it for sale (I have seen older 4 port version and newer 2 port vewrsion a lot) and I would like a proffessional opionon on the market value of this particular model.

2 controllers both works good and there is no visible cosmetic damage. The lid that covers the controller is in great shape. It also have the unusual RF switch box that works with the originial power supply.

Please reply via email if possible. Thanks in advance.

As I'd stated in the email, there are two such programs I use with
spartados, both provide double directory and display on 80 col format.
One was written completely in assembler and was called DDir.com. The
other, and the one that is the first to boot when my SpartaDos boots is
WDir.com (written in Action! and compiled with the runtime package).
Version 1.11b written by some Jon D. Melbo person :)

>
> I was under the impression that this was David's emulator, and hence,
> I would expect his web page to contain the "official" version. Or has
> he turned over development to someone else?

David followed and guided the improvements of various authors - he didnï¿½t do much himself after 0.8.6 - the current maintainer is Petr Stehlik. He is holding a team of various talented individuals together to finally get to 1.0. It seems they concentrate on DOS, Windows and Falcon - although you could check Petrï¿½s site at

http://cas3.zlin.vutbr.cz/~stehlik/a800.htm

which is in a way the current official site for the Atari800 source and the DOS binaries. They will incorporate all good parts of the Thor version into the official one (I guess in 0.9.4) so that hopefully this fork will remain a one-time event and all will concentrate on just one, eventually perfect, emu.

A good idea would be to host all sources and all binaries on one site...

Cheers,

Julian

There are two other newsgroups at least where Atari 7800 discussions
are just as welcome as they should be here: rec.games.video.atari and
rec.games.video.classic.

>I just purchased (over the Internet) a mint-in-box version of Asteroids

>The game features simultaneous play for two, team or competitive.
>

I was also pleased with the graphics and sound for the 7800 version of
Asteroids, quite a step up from the 2600 version (although the 2600 is
more nostalgic for me).

>On the downside: the playfield feels small. The asteroids do not loom.
>In the arcade Asteroids the asteroids would really loom. In this game
>they seem kind of smallish. They still blow up into 2 then 4 parts, but
>this game could really have used some looming asteroids.
>

I never really noticed that before. I think alot of the looming
effect was the thrumming, sense of impending doom music in the arcade
version (just like in the original Space Invaders). The one version
of Asteroids I have seen for home systems that appears to capture the
essence of the arcade version was one I downloaded for the Amiga a
couple years ago. The asteroids loom nicely in that one. :3

Steve,

Er, um... sounds like you've done this a time or two yourself, yes? (;-)

It took me a couple of readings to see the whole picture. The key would be reaming out (slightly) the drive shaft hole so the gear can "close up" the gap a bit, yes?

I bought some 1/8" shrink-wrap tubing from Radio Shack yesterday, and I think I'll try that in place of your string. If I can't get it to work just by binding it with the tubing and a teakettle, I'll try reaming out the hole, as you suggest, and maybe a bit of contact cement. Or is there a reson to prefer epoxy for this?

The good news is that I got one printer working. It only took me about twenty minutes after sending my letter to the ALPS Department Of Absurdly Old Eequipment to realize that the print head motor gear and the paper feed gear are identical (duuuh!). So... I now have one printer with two working gears, and one with two split gears.

These are a_maz_ing little printers (when they're working)!

Also, thanks for mentioning Best Electronics. It's always nice to have a fall-back position in case _none_ of these approaches works (;-).

Cross-posted to:
comp.sys.atari.8bit,rec.games.video.classic,rec.games.video.marketplace,aus.ads.forsale.computers.used,comp.sys.msx

I have the following shrink-wrapped Atari XE cartridges for sale/trade:

* Lode Runner (2 copies)
* Archon (2 copies)
* BallBlaser (1 copy, shrink-wrap unsealed)

These games will work on any Atari 8-bit except the Atari 400 and Atari 800.
The boxes are in excellent condition.

I would like to trade for any of the following (in order of preference)

* Keyboard for Pioneer PX-7 computer
* Atari 410 Program Recorder
* Vectrex cartridges (preferably with overlays)

If you don't have any of these items, I will accept cash. :-)

I realise that some of these trades may be uneven, so I'm willing to make a
cash adjustment for some of the items.

Thanks in advance.

3877. Notes on HD install with MIO

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-20 00:00:00 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <6hehv6$kg9$1@pale-rider.INS.CWRU.Edu>

Some Notes on using Hard Drive(s) with MIO
Russ Gilbert

These notes cannot/do not replace the MIO owner's manual. It is intended to give some helpful hints that the owner manual may leave a bit unclear.

The MIO can only use hard drives with 256 byte sectors. These would be only the older MFM, RLL and SCSI hard drives, probably less than 100 megs in size.

For MFM and RLL hard drives, a SCSI to MFM or SCSI to RLL adapter/controller must be used. The most common is the Adaptec 4000A, aka ACB-4000A controller, used with a Seagate ST225 20 meg hard drive. Any 256 byte/sector mfm hard drive can be used with the MIO and 4000A, however. The RLL Adaptec controller is the ACB-4070. I don't think using RLL drives with the 4000A or a MFM with a 4070 is a good idea. 256 byte/sector SCSI hard drives exist, such as the Seagate ST225N. SCSI hard drives have the controller built into them, so no 'in between' controller is needed.

SCSI uses a convention of ID number and Logical Unit Number (LUN). It seems the ID number is always 0 for a setup with a single controller. ie. the ID number identifies the controller number. I suppose you can somehow daisy chain controllers. You'd have to daisy chain controllers if you used two SCSI drives, which would have two separate controllers (remember the SCSI has built in controllers).

The LUN is the physical drive number. You must set a jumper on the drive itself to indicate which drive it is. 0, 1, 2, 3 etc.

So, drive 1 on the controller is ID 0, LUN 0. Drive 2, attached to the same controller would be ID 0, LUN 1.

The MIO also can use SASI drives. I have no idea what these are.

Ok, now to my notes on specifics of setting up.

I. THE CABLES. POWER SUPPLY AND JUMPER SETTINGS:

Keep your cables short. No more than about one foot in length is probably best. Any pc power supply can be used that has the 'standard' four hole 'D' shaped power plugs. Newer power supplies may not have the correct plug, or an adapter may be needed. The power requirements of the controller and HDs should be carefully determined, and matching power given to them.

There must always be a drive 0. If more than one drive is to be used, the termination resistor, somewhere on the hard drive itself, must be removed. Only the last drive MUST have this termination resistor and no other drives can have it, as I understand. There are no termination resistors on the cables themselves (the MIO documentation seems to indicate there should be.) Sometimes the termination resistor isn't where you can get at it, it is inside the drive someplace. Possibly a drive like this would have to be the last drive.

Set the jumper which selects the drive number. The first one for drive one. These jumpers can often be identified by searching for drive information from the drive manufacturer on the www (eg. www.seagate.com).

A fifty pin ribbon cable connects to the MIO. The red 'line' on the cable is wire #1 and goes to pin 1. Pin one is at the top back of the MIO. It is possible to put this ribbon on backwards. With the pin type headers, great care and patience should be taken to line up the holes and pins and gently push the cable connector on the pins. Removing the connector should be done slowly, probably prying with a small screw driver, first one side then the other. It is VERY easy to bend and break the head pins, great care must be taken installing and removing the cables.

For MFM and RLL drives, there is a 34 pin and a 20 pin ribbon cable to the drives, coming from the adapter. The 34 pin can be daisy chained. Each drive gets a separate 20 pin ribbon. The J0 on the 4000A is for drive 1 and J1 is for drive 2. Be sure the 20 pin connections and the jumper settings on the HD match. And be certain of the pin 1s on your connections. More than one connection can be done backwards. The slot connectors with a notch are nice because you can't put them on backwards.

II. WITH CONNECTIONS MADE, YOU ARE READY TO POWER UP:

The sequence is first hds, then MIO and finally computer.
The hard drive lights should blink a few times and the controller light should blink a few times, then all hd and controller lights should go out (if they don't, something is wrong with your setup or hardware). With lights out on the hd and controller, turn on the MIO.

Finally turn on the computer. Hold SELECT and hit RESET to enter the MIO menu. Select 'T' for drive type, and hit 'N' to select the number of the drive you want the hd partition to be. The MIO menu determines a hd partition. A partition cannot be larger than 16 megs. You can partition a single hd to be more than one 'Drive #' in order to use more of the hard drive over 16 megs.

I'm only going to describe a single hard drive setup. If you understand this, you can add another one.

Say the hard drive is a 20 meg. You want a 16 meg partition and a 4 meg partition. You select, say, drive # 3 to be a Hard drive. I forget when you hit SPACE and when you hit ENTER, but you go thru the

interface, ID, LUN, Cylinders (Drive size is automatically computed), Heads, Start Sector and End+1 sector. For a 16 meg partition, the start sector should be 1 and the End+1 sector 65536. The number of cylinders and heads you have to know from the hard drive manufacturer. Often, this is printed on the hd. For a second partition on the same physical hd, you would start with sector 65536 and end with the about 81180 (for 20 meg drive).

Ok, you can't save the configuration yet, the hd hasn't been low level formatted. For this use the hdfmtph6.com on the MIO disk you got. I had best, actually only, success with hdfmtph6. Other hds may do better with one of the other hdfmtphX, but hdfmtph6 worked best for me. You will be asked the ID, LUN you want to format. 0, 0 for the first partition. Then you'll be asked what type of controller you have. Finally you'll be asked 'buffered' or 'unbuffered'. You might get a hint from hard drive tech specs on this, but 'Buffered' worked best for me for a ST225 and Olivetti XM 5220/2.

The behavior of hdfmtph6 isn't very friendly, it doesn't let you know if it is hung or what is going on. Normally you begin the low level format and the hd light comes on for some time. Then the screen shows verifying blocks and the # of blocks to verify. If an error occurs, the whole process starts over. If lots and lots of errors occur, there is probably something wrong with your setup. Also, if the initial stage, before the verify, takes longer than, say, five minutes, something is wrong. I waited an hour once, I think. Everything could burn up, or something, the program just keeps going, saying nothing.

A successful completion of hdfmtph6 will tell you success and tell you also the number of sectors on the hd. Write this down, as it is the last sector you can use for partitioning in the MIO menu.

Finally, you go into the MIO menu, save the configuration and then run hdfmtdir.com to put the Atari Directory structure on the hd.
All above is with SpartaDOS. MyDOS may have some differences, and, actually I suggest using MyDOS with the Black Box and SpartaDOS with the MIO.

Copy DOS (say x32d.dos) to the hd, type 'boot x32d.dos' and now you can boot from the hd. The MIO configuration will load from the hd when you do a power up sequence. Other than the first time, you can leave the MIO on all the time. Just be sure the hd is up to speed and finished initializing before turning on the computer.

My ramdisk program should be able to support it. If you know which
bits at which address in RAM are used for bank switching the extra RAM
then you should be able to configure it to recognise your extra RAM.
It will work with any DOS that doesn't use the RAM under the OS. If
it doesn't work and you give me the details then I might be able to
support it in the next version.

The program is available from the atari archive (in
8bit/OS/ramdrv10.arc) and from my webpage
(http://www.co.umist.ac.uk/~rje/8bit/atari.html) however I've just
been informed that the arc file version on my webpage won't unarc (and
presumably the version at the atari archive will suffer the same
problem, as they are the same file). I downloaded it from my webpage
over the weekend to try and unarc it, but then I left the disk at home
(argh! - I'm a couple of hundred miles away now!) so I'm going to have
to download it again. Has anyone succesfully downloaded and unarc'd
the file? If you can't unarc the file, then the executables are also
available on my webpage (again, has anyone downloaded and tried
them?), hopefully they will be ok. The manual is also available
on-line.

> emu.

I really wonder why an obviously inferior version of the A800 emulator
get's declared 'the official version' here. I watched the develeopment
of both emulations closely and clearly have to say the Thomas Richter's
version (the Thor version) is by far superior to both 'the official'
versions of A800 and A800win.

To understand this, you have to take into account, that Thomas develops
on a SGI-Unix-Box (not in a DOS or Win environment). Therefore there are
no fancy 'new features' like 8-Bit joystick support or a new pokey sound
library or a Win95 user interface, because Thomas simply can't test this
stuff. He is strictly concentrating on the faithful emulation of the A800.
This required some rewriting of David's original code, as some structures
there were simply not efficient or not flexible enough to model the real
A800 (for example the central dispatcher was removed completely).

With this in mind, it will not be as easy as simply taking a few portions
from Thor's code and putting this into "the official version". Better take
Thor's excellent emulation core and fix the surroundings for dos and windows
(of course utilizing "the official version). It already compiles for the
SGI, Sun Solaris and Linux (for the latter the X11 version only, the linux
version may need some fixing of linux specific stuff).

I compiled both emulator variants on these plattform for a little comparison:

A800 Thor A800 "official"

Dimension X perfect title picture broken
Seawolf II perfect freezes
Flight Simulator II perfect freezes upon load
Hijack perfect video crashes
Fort Apocalyse perfect (a800 mode) jumps into basic
The Snapper perfect crashes

BTW, the "official version" also has some glitches in a UNIX environment.
On a Sun it doesn't compile at all, due to a longword alignment bug.
Obviously it is hard to keep all variants of David's emulator alive,
so I suggest to compile a list of 'platform specialists' for

each of the platforms and add support around Thomas' excellent core.
If you don't believe me, compare the faithfulness of both versions yourself
(compile the x11 version on a LINUX box).
BTW, I'm not interested in advocating for this or that version, but
some of the statements in this thread really needed clarification.
For the emulator community, competition is the best thing that
can happen.

Have a nice day

Frank-Oliver

>could check Petr's site at

>http://cas3.zlin.vutbr.cz/~stehlik/a800.htm

>which is in a way the current official site for the Atari800 source and the
>DOS binaries.

"In a way?"

If you go to that web page, it links back to David's page for the
"offical" source, which is 0.8.6.

So as I see it, there are three versions of the Atari800 emulator now.
There is David's official version. There is Thor's branch (which
broke compatibility for many systems, including Linux, but has better
emulation in many cases, apparently). And there is Peter's unofficial
"official" development branch.

And just to confuse things a little more, I have a small collection of
patches that I've sent to David and Thor, but I'm not sure if they
have done anything since receiving them:
http://www.cs.dartmouth.edu/~crow/atari/patch/
Those patches do the following:
-dir.patch.gz:
Allow browsing of subdirectories when mounting
disk images.
-rtconfig.patch.gz:
Use an array of strings for the default location of
the configuration file. This was motivated by a
desire to user /usr/local/etc instead of /etc on
my system.
-sio.patch.gz:

Fix the offset calculation for DD disk images, as
the ATR format has the silly approach of using only
128 bytes for the first three sectors.
-ui.patch.gz:
Add a menu option to display the current keyboard
and controller information. This one isn't ready
for real use, just as an example of what would be
useful.

>Frank McKenney asked for help with repairing/replacing the drive gear on a 1020 >plotter.

This may be a little late to be of benefit, but I repaired the gear on my 1020 by doing what appears to have been already suggested. Drill out the hole so that it allows the gear to fit on the shaft without gapping at the split. If you enlarge the hole by pulling the gear back and forth over the drill bit, you can better control the amount of material that is removed. It takes longer, but you can get a very close fit. I found a product called 'Plastic Welder' made by ITW Devon to work better than anything else for this type of application. It is specially made to bond plastic to metal. Lightly sanding the metal shaft by rubbing the sandpaper along the axis of the shaft will help improve the bond.

Good luck.

Gail

OK, here's what to do (or at least it worked for me):

1. Format a disk in double density on your Atari. I used Superdos 5.0.
2. Put the disk in your PC's drive, and use Util (found in the MyUtil
package).
3. When copying files over use: UTIL -WB filename

This worked for me and my XF551 with Superdos 5.0. I should think it would
work with the 1050 (and any other double density drive) just as long as you
remember to
format in double density.

If it doesn't work the first time, try some other disks. I discovered that writing to certain types of disk didn't work when reading on the Atari.

3892. Boot problems!

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-20 00:00:00 UTC
From: Christian Fowler <nospam-cfsoft@mailcity.com>
Message-ID: <01bd6cb6$d7f5cda0$14d8ccc3@default>
Source record: 63656

I recently downloaded the SpartaDOS 32G binaries and ported them over to an Atari disk using MyUtil. I used Superdos 5 to format a single density disk, and copied the X32G.DOS binary over to that disk.
The problem is that that disk won't boot! I also tried MyDOS, DOS XL and DOS XE all
with the same result. The SpartaDOS disk only prompts a "BOOT ERROR!" message, while the others boot but don't go to the DOS menu!
Does anyone know how to successfully make a bootable disk in this manner with binaries downloaded from the net?
I wish there was an ATR to Atari disk copier like Util. In fact, I might make something like that myself.

Thanks!
Christian Fowler

Attention Mac Users!

(No, that's not a typo...I know this is comp.sys.atari.8bit :-)

Announcing the debut of a new Atari 8-bit web site especially for Mac users:

Mac/Atari Fusion

Atari 8-bit Resources for Mac Users

http://www2.bitstream.net/~marksim/atarimac/

If you own a Mac and want to know how you can use it with your old Atari
Home Computer system (400/800/1200/800xl/etc.), this is the site for you.
Topics include:

* Emulators
Run your old Atari games and stuff on your Mac

* Connecting an Atari 8-bit to a Mac
Transfer files and software to your Mac and back

* Sharing Your AV Mac's Monitor with an Atari 8-bit
Use your AV Mac's monitor with your Atari

* 8-bit Fun With QuickTime
Capture video and audio off a real Atari
(Features video from Star Raiders and audio from Ballblazer!)

* Mac/Atari Utilities
Where to find software to work with Atari disk images and files

* Missing Pieces
Projects for the ambitious

...and more to come!

Stop by for a visit and let me know what you think. Submissions are welcome.

Hi David and all other A800 emulation enthusiasts,

I just doublechecked "Fort Apocalypse" and in fact it runs 100% on Petr's
Version. Same is true for "The Snapper" and "Hijack". As far as I could
reproduce, this was really caused by the Basic cart interfering with the
respective program.

However still not working properly are:

Dimension X (Kernal generated title picture)
Flight Simulator II (doesn't finish loading)
Seawolf II (display broken)

Furthermore I found:

Carnival Massacre (title doesn't come up)
Mirax Force (doesn't load in 130 XE mode)
Triumph (fails to load in XL mode)
Deluxe Invaders (topmost character line flickers in game)

Test environment was a Pentium90 Linux based machine. Thomas' code was
his 0.93 betaversion (which he hopefully also has on his site) and Petr's
version was his 0.93b (downloaded yesterday).

All the above work without any problems on Thomas's version, so I still claim
it's core emulation is superior. This is not intended to violate anybody's
feelings but is plain fact - at least currently.

As I happen to have the A800 Hardware Manual I provided both authors (Petr/Radek and
Thomas) with the same Information on the ANTIC DMA timing in february plus
a rather clumsy rewritten piece of David's code. Both agreed that this already
improved the original situation in some way, but still some programs critical
with regard to interaction of CPU and video that required exact timing wouldn't
work properly. Thus both authors replaced the quick hack I made from the HW-Manual

Info by their own more precise modelling. This was also necessary, because the HW-manual ist contradictive in some areas. At least currently it seems that Thomas' model is more precise.

So David, my suggestion would be to put a link to both Petr's and Thomas' versions on your site, and let the users decide which way to go. Of course no one claims that Thomas's version is perfect, so I think all bug reports on his version are welcome as well (please try especially those programs you know to be critical). But it's relly getting hard to find stuff that doesn't work :-))

One more word about the future: As Thomas just told me, his version is not going to be bagged. Development continues as he find's time to implement new features. Thomas is btw. still looking for a good DOS/WIN95 programmer to fix up the stuff for this platform.

Ideally I would like to see both versions being developed in a competitive way - just like ADoom and DoomAttack on the Amiga, which both originate from ID's source code but develop in different directions. Every now and then they share pieces of code but there never really is a common source. This would kill competition. Both Amiga Doom variants already have lot's of features the original source lacks. Of course this is also true for PC Doom source code projects.

The "freezer feature" mentioned here would be a nice start. Ideally the internal state of the emulator would get saved to a disk image in a common format (just like atr for the images). This would make "saved states" interchangeable between various emulators (not just A800 variants), which would interpret the data when reading in the saved state disk image. Of course an additional bootloader could use some of the "internal state data", to run the state on the "real thing" (maybe in conjunction with APE). In the late 80s I developed a freezer package called "replay", which consisted of a switch and a disk of software capable of freezing a program's state on the real Atari soley via software. Problem here was to determine the contents of write only hardware registers, which was in fact done mainly via side effects (e.g. cycle counting to determine video modes, collision checks to determine player/missile positions). Some stuff (colors and audio volume/distortion as well as priority) had to be adjusted via interactive menus. I currently don't have the time to crack this beasty (i have the source, but the protection check is burried deeply into the code). If somebody wants the loader code from this freezer (to hack it and make a state image disk selfexecuting on a real atari), feel free to ask.

Have a nice day

Frank-Oliver

This debate seems to have taken a down turn with people making inaccurate claims about game compatibility etc etc..

Im a keen user of Rich's Windows port, personally I think its a cracking version mainly because 1. I use win95 and 2. I can have a more realistic sized screen ie its right for me and my machine. What I don't like to see is the non programming people or non Atari800 (whatever version / branch) who have lots of idea's but feel its their right to barrack the very people who are striving to give people the best possible emulator by combining idea's...

Im not saying that this has happened YET but its moving down the same line as the Arcade emulator authors who get crap emails from people demanding that they make their games work etc etc..

I would hope that people use the emulators and send constructive comments that relate to bugs or possible idea's for enhancement rather than "my game don't work..". I know this is STANDARD decency but you still see quite the opposite from time to time in the NG..

As for multi branches of the A800 coding well lots have been added because of people trying to add something beyond the original code, as long as its all shared then its not a bad thing..I think..

Here's to a great team of people who want to give us the best Atari emu possible....Lets encourage rather than discourage them..

Try using Atari800 in either of the ports (Dos or Windows 95),
certainly the Win95 version plays it a treat now.

Listen out for the dodgy pilots :)

I remember a review of a game in one of my old New Atari User magazines
from quite some time ago. It was of an American game that came in this
special limited edition box. Well, anyway you were supposed to fight people
in this bar. You know, break beer bottles and chairs over their heads.
I believe the name was "Pondering About Max's", or something.
Anyone have an idea what this game was called, and if it's available
on-line?

Thanks,
Christian

Hi! I have a few 8-bit items that I'd like to trade away. I'm interested in Atari 2600 games/manuals, and most anything including consoles for the 5200 or 7800. I've also got a Sega Genesis+CD, and an NES (I'd like to find a top loader) if you've got stuff to trade for those systems. If I can't trade them away, I'll also accept cash offers.
I have for trade one Atari 800xl body, one 600xl body, and one a/c adaptor that will work with either one. I have Star Raiders and River Rescue carts loose; River Rescue has a bit of label Damage. I also have a copy of Microsoft Basic 2 for the Atari computer, in nice shape with the cart, box, and manuals, but missing the extension diskette on 5 1/4" floppy (not needed to run the cart). The hardware and cartridges have all been tested and found to work.
If you're interested, please respond via e-mail, and thanks for looking!

George K.

Sparta dos has a unique format. If superdos (not familiar with it) can not produce the tracks that Sparta Dos does then the programs will not work. If it does once moved over you need to tell the drive through the command. BOOT D1:X33g.dos this activates the sparta disk and dos so it will be able to boot.

Vidar,

Given Terry's exceptionally bad reputation I am amazed that anybody would send him money. Do a search on DejaNews, especially the old archives.

BTW he threatens everybody with lawsuits. They are just threats. I would keep him on the bad trader list. Not that it will do you any good but ask him to provide you with the tracking number of the package. He will, no doubt, give you some elaborate excuse but in reality (even if he did ship, which I sincerely doubt) getting the goods delivered to your is his responsibility. If they don't show up an honorable trader would refund your money (or send a replacement). Don't expect either.

Later,

Ron

I have the following for sale:

256k MIO with docs, software and box Works perfectly!
Includes 130XE adapter
20 MB Seagate Hard drive mounted in a Baby AT sized desktop enclosure w/
power supply. one half height bay still open
MFM-SCSI controller card.
All hooked up formatted and ready to be connected to an 8-bit.

A plug and Play 20MB hard drive for your 8-bit. It will love you
forever.

I am only asking $120 plus shipping or best offer.

Everything works 100% but I already have a Black Box setup so this is
secondary.

Will also consider a partial trade for 8-bit carts I do not have

Sorry to hear about your problems with this guy.

Do a search using www.dejanews.com for "old" posts, and search for Terry Ortman, and /or "Starfleet Software" aka many different names. You will find LONG threads discussing him, starting back in about 1995/1996 in the misc.forsale.computers.pc-clone.* newsgroups.

I won't say any more (to avoid risk of retaliation on myself), but just do some searching and you'll be *quite* enlightened.

Good luck on your endeavours.

Want to help me track down all those good old classics that have been
recreated on the PC?
Hmm, I hear you all say: Get yourself an emulator, or the real thing...
Well, I think it was cool to see Manic Miner in a faithfully remake,
that's gone through just a slightly face-lift...

At http://w1.2222.telia.com/~u222200549/remakes/ I have set up a list
of home-computer games that have been remade to the PC.
So far I have found Manic Miner, Jet Set Willy, Splat!, Knight Lore,
Super Sprint, Giana Sisters, and Atic Atac.
Do you know about others that have been remade, or are being remade?

Borgar.

<fom_nsp@mchp.siemens.de> wrote:

Preface: I, among many other people, am currently working on David Firth's Atari800. No, it has not branched into hither and fro. I will get to that in another message. First, I'd like to to address a couple of things here:

>I really wonder why an obviously inferior version of the A800 emulator
>get's declared 'the official version' here. I watched the develeopment

I do not particularly care for your tone, nor do I think your statements are accurate. I don't know where you are coming from but you certainly aren't basing everything you say here on facts.

>To understand this, you have to take into account, that Thomas develops
>on a SGI-Unix-Box (not in a DOS or Win environment). Therefore there are
>no fancy 'new features' like 8-Bit joystick support or a new pokey sound
>library or a Win95 user interface, because Thomas simply can't test this

Pardon us for adding joystick, sound, and a user interface. We'll stop work on that right away. I do not belittle Thomas his efforts (in fact, I very much support him) but your flippant attitude to features that users really want and platforms the common person has (instead of SGI's, which I very much doubt have the penetration of Win95) misrepresents them from what they are: useful and serious contributions to the project.

>stuff. He is strictly concentrating on the faithful emulation of the A800.

And how do you know that we are not?

>This required some rewriting of David's original code, as some structures
>there were simply not efficient or not flexible enough to model the real
>A800 (for example the central dispatcher was removed completely).

This is not a statement of fact, it is opinion. We have before, and probably will again, talk to Thomas about what he's doing - but it cannot be called universally "better" than continuing efforts on Atari800. Some of his changes are even incorporated into the current Atari800 source tree. However, some were not, and there were valid reasons for it, mostly dealing with how code can function very differently on a multi processor SGI box and a 486 running DOS or a Falcon/TT.

>I compiled both emulator variants on these plattform for a little comparison:
>

> A800 Thor A800 "official"
>
>Dimension X perfect title picture broken
>Seawolf II perfect freezes
>Flight Simulator II perfect freezes upon load
>Hijack perfect video crashes
>Fort Apocalyse perfect (a800 mode) jumps into basic
>The Snapper perfect crashes

I have no idea what version of Atari800 you were using, or what
version of Thomas' code. Suffice to say the chart above is wildly
incorrect for the version I just compiled ten minutes ago under NT.

>Obviously it is hard to keep all variants of David's emulator alive,
>so I suggest to compile a list of 'platform specialists' for
>each of the platforms and add support around Thomas' excellent core.
>If you don't believe me, compare the faithfulness of both versions yourself
>(compile the x11 version on a LINUX box).
>BTW, I'm not interested in advocating for this or that version, but
>some of the statements in this thread really needed clarification.

Your second paragraph contradicts your first. Quite obviously you are
heavily in favor of Thomas' code. I don't believe you've done a valid
comparison, but that's neither here nor there - your opinion is your
own and you are free to share it with anybody you wish. I do know that
you didn't have all the facts about how Atari800 was being worked on,
so I really don't think you should be riding a high horse at the
moment. Nor have you seen an equivalent version of Atari800 to the
current source you are using for Thomas (if you are, then something is
wrong, since your results running programs are very different from
mine).

>For the emulator community, competition is the best thing that
>can happen.

This is one of the few statements you have made that is an unqualified
truth. I strongly urge everybody to pick whichever emulator they like
the best, but do them all the justice of comparison.

Hi everyone,

I have just updated the site with even more goodies. And as soon as I get a chance I will even put more items on the list (darned full time job of mine gets in the way of my hobby. Ha!) There are quite a few new Atari items. Get to them before they dissappear!

I also have some 10 packs of recycled 5.25 inch DD floppy disks available too.

http://pw1.netcom.com/~jonart/VMC/default.htm

Be sure to come back often. You never know when I will update it and you do not want to miss out on some of the things I find(Heck I even suprise myself with my luck of finding the vintage goodies).

Have a great week everyone!

Jon

>one at Thor's site (version 0.9.2,
>http://www.math.tu-berlin.de/~thor/thor/index.html).

Here is what is happening as I know it.

Thomas (the Thor) emulator has in fact made a branch from David Firth's original code base. The folks who are working on Atair800 (Petr Stehlik, Raster, Perry Mcfarlane, myself, David Firth - yes he is still around, and recently Matthew Conte) spoke to him about it (actually Petr did most of this) and asked if we should merge together.

Thomas had made some broad changes, and didn't want to go back to the core way Atari800 worked. Equally, there were some changes he had made that weren't going to go down well for say, the DOS port of Atari800. So what we decided was to keep these two apart for now, but share changes/etc as we went along. It's unfortunate that Thomas chose to continue the numbering scheme of Atari800, as it led to some confusion. We did mention this part to him, btw.

Now, David Firth is apparently very busy these days. He wanted Atari800 to continue on but couldn't be spending time keeping his web site up to date, etc. So Petr offered to do that and also, at the same time, I (along with everybody else) started pushing to get our code trees back together. We did that and the result is update on Petr's page (http://cas3.zlin.vutbr.cz/~stehlik/a800.htm). BTW Preston I believe your suggestions were being handled by Perry, but I may be confused. If so some of them may already be in. I will check.

This is not a "branch" from David's work. It is a continuation of HIS emulator. It's just a fact of life he doesn't get to update his web page often so it doesn't reflect the later source code. I made a point that I did not want to create a branch - because I felt it was wrong to take what is in essense a very large amount of hard work that David did and then say it was a "new" emulator. Just didn't seem right. Everybody else felt the same way, so we wanted to keep the spirit of David's original work as we moved forward with it: portability between environments, continuing refinements to the emulator core, and of course acknowledging the fact it was not ours at all but David's

really.

Petr got our code merged back around 0.9.0 I think. He managed to find us a mailing list host, and we've been using that pretty steadily since it started up (earlier we were e-mailing). We've identified several problem areas in the emulation core and they are being worked on in parallel.

There, that's the story. Make of it what you will folks. I'm going to go back to working on a state-save for David's emulator.

Apparently these cartridges *will* work on the Atari 800, and also on the
Atari 400 if it's RAM is expanded to 48K.

> The boxes are in excellent condition.

I also have 2 bare Lode Runner cartridges (with photocopied instructions) if
anyone is interested.

There's a slight problem here. I live in Australia, and our mains is 240V
AC. This means I really need an Australian or British Atari 410.

I haven't tried the others recently but I know that Fort Apocalypse has
worked (and still does) for a very long time. Your problem is that you
are starting the emulator in Atari 800XL mode with basic enabled.
Earlier version of Atari800 defaulted to standard Atari 800 OS/B. It is
likely that some of your other problems may be solved by switching off
XL emulation - the OS is slightly different which causes some programs
which make illegal OS calls to fail (which is why the real XL also had
various translator disks)

Lets try and clear this up. I haven't had time to do any work on
Atari800 since the early 0.8.x versions - this was due to workload and
all the travelling I was doing. Then Petr, amongst others, started to
send patches which I didn't have time to integrate. Petr sent me
complete tar/zip files for the later 0.8.x versions which I eventually
(i.e. not as quickly as they would have liked) uploaded without
modification. It soon became clear that I had become the bottleneck to
further development, so it was agreed that Petr could release new
version directly on his web site - I also contain a link to Petr's site.

MyUtil only supports DD disks. That's not my problem. I was able to copy the X32G.DOS file over to a DD disk in my PC and read it on the Atari. However, Myutil doesn't write to the very first sector of the disk, so I had to copy the file over to another pre-formated disk on my Atari, but the new disk won't boot.

[lots of verbiage in the original posting has been snipped]
->can anyone help me here? tell me whats wrong?

Your original posting was so vague and murky (not to mention the
juvenile impression left by your use of exaggeration and the small
"i") that it's hard to say exactly what the problem is. But if you
made one thing clear, it's that you haven't gotten anything to work.

Are you up to speed on the differences between various densities?
You say you have a DD (double density) disk drive but you also men-
tion trying a single density utility. Some programs work in one
density but not in another. The "Myutil" (or "Util") program will
do everything you're looking for (in double density; i.e., 360K).
I've used it successfully so I can attest that it works.

However, the tiny doc file that comes with it isn't very helpful.
A few quick hints: It may be best to format disks on the Atari side;
"Util" requires that disks consist of compacted files (i.e., consecu-
tive sectors); and an XF551 works best for writing disks that "Util"
can read.

(Ewwwww! I love followup my own post)
The Seagate doc on ST225. It doesn't give bytes/sector, just
total capacity in megs (1,000,000 bytes, not 1,024,000 bytes).
tracks, heads, discs, other stuff, sectors per drive.
The point is, I'm pretty sure Seagate is specifying 512 bytes
per sector, not 256. The other point is, I think probably ANY
MFM drive will work (or can at least try it), with MIO
and Adaptec 4000A, the bytes/sector isn't all that important.
The hdfmtph6 will make the 256 bytes per sector with 81000
'blocks'=sectors, whereas the Seagate doc says 41820 total
sectors.
Another thing. The termination resistor 'bank' or 'network'.
IT TOO CAN BE PUT IN BACKWARDS. So make a mark on the 'outside'
of it if you remove it, so you can put it back in properly.

It's the fault of the emulator. To be precise, the CLI command is not
implemented correctly.

So long,
Thomas

Sorry to correct you here, but first I would still say that its emulator core
is more advanced than Petrs version in a couple of ways, but there's no port
to DOS or windooze; this version is for unix only. Because sound is a rather
hard trick for unix, there's currently NO sound at all, but a complete pokey
emulation including pokey interrupts and other nasty tricks.

For the continuation story: This version is continued, but I keep supporting
Petr. We'll try to merge both sources in the long run and will just start with
the SIO interface. To give you some examples, I just started to implement some
of the extended "Happy" instructions there, so programs like BiboDos and others
will work in a future version. They "sort of work" in my current version which
is not yet made available at my home site because I'd like to finish this SIO
part first. However, if anybody is interested, just drop me an EMail.

>The
>main Atari 800 team is looking at Thor=B4s code and will implement the

Well, let's say I'll try to get Petr informed about my bug fixes, too.

>The current 0.9.2 is by now the by far best Atari 8-bit emu. It is far
>better and faster than XL-it - examples for the high compatibility are
>the PERFECT Lucasfilm Games titles and The extremely advanced Pokey
>emulation (2.4 by Ron Fries).

The lucasfilms title was actually never a problem for my emulator, and that's
actually a long time ago I made it working. As I said, there's currently no
sound as this requires some heavy magic for Unix. I don't have an idea how to
do that.

>Atari 800 is on the best way to be the first 100% 8-Bit emu...

Well, we try our best.... (-:

Yup, tanks for all! Especially for this one. The new version will, as I said,
contain a very complete and updated SIO emulation.

> -ui.patch.gz:
> Add a menu option to display the current keyboard
> and controller information. This one isn't ready
> for real use, just as an example of what would be
> useful.

That's still a problem since the mouse and joystick configuration is just a
bit different for Unix. I included this menu as good as possible, but there
remains something to be done.

So long,
Thomas

You can build yourself an APE or ProSystem interface in about 15
minutes. Its got to be less stressful than going through all that just
for one disk.

You can get the plans at the URL below :)

The difference is that Frank-Oliver always asks me about my latest version,
and that handles all the games in the list above just as it should. I just
didn't want to publish the current 0.9.3 beta in public, because it's not
yet finished. Thus, to get a fair comparison, don't use a version that's
ages old. (-:

Just to give you some examples:

FS-II suffered from a bug in the CPU emulation that has been fixed, and another
rather strange feature of the VCOUNT register that has been fixed too. DimX
had a scrolling problem because I called the border clear routine at the wrong
place - that was a five second fix. Hijack and some others failed for the not
so well adjusted DLI timing, which is way better now.

>>Obviously it is hard to keep all variants of David's emulator alive,

Well, all I have to say is that I *will* publish the current emulator source to everybody who's interested in testing it. However, it's in not yet a new 0.9.4 because - as I said - the SIO stuff is not yet complete.

I hope this clarifies the thinks a bit, especially why Frank-Oliver got better test results than you...

So long,
Thomas

get the xformer pc-atari emulator from the umich archive. it has a
sparta bootable atr image to boot from then format and write dos to a
physical disk. Or you can get discommunicator from the archive also
and the x32g disk image and write that also with your atari. I know of
no way to build an atari bootable disk directly on the pc tho.

I think we got the VCOUNT problem (I remember a note about that
somewhere). What was the CPU bug? Did you e-mail Petr with that? I've
been meaning to go through CPU pretty heavily, but it looks like
Matthew Conte is going to replace it with Neil Bradley's 6502 code,
which is really first-rate, so that might fix several problems.

DLI timing remains an issue for us as well. I sometimes wonder if the
only way to truly fix various timing is to go single-cycle, but that
would rule out anything below a P200 as a viable platform, and it
would more or less toast Windows ports of all variants. Win32 is just
not that real-time. Frodo has a single-cycle mode and it runs about
40% speed on a P233. Ugh. (It's cool that they have it though, not
trying to say it isn't useful code).

Right now I'm writing some state-saving code, and looking into
something I think might be wrong with HITCLR being set incorrectly in
some games (Darek Mihocka found this).

BTW, do you know if Pokey can adjust volume more than once per
horizontal blank interrupt (once per scan line)? I think that might be
the key to getting Berzerk speech to work, sort of, but I don't know
much about Pokey I'm afraid.

>Well, all I have to say is that I *will* publish the current emulator source

Sure, never thought you wouldn't. I'm sure we'll be trolling through your stuff to find what we can use too :-). I just don't understand why people want to make a this-or-that emulator war out of things.

I want to sell my complete collection of Next Generation magazines.
I have every issue (1-41) in great shape. I will only sell as a complete set.
I will be accepting any offer over $200 until this Sunday (April 26) at
midnight.
The highest offer at that time will take the whole collection.
A magazine box full of 41 magazines is a bit heavy, so I estimate Priority Mail
shipping would probably be around $12. I'll post the high bidder once each day
to these newsgroups. Just e-mail me your bid, along with your name, address
and telephone number. I have references on eBay for those that need them.
Thanks for looking. Take care.

Have you tried using Ron Fries Pokey routines and writing the output to
"/dev/dsp" or "/dev/audio"? It worked OK for me under Linux and I had
promising results a while back writing to /dev/audio under Solaris - the
only problem was that the Sparc Station 2 I was using couldn't process
at 100% full speed resulting in choppy sound.

I recently bought an Atari 600XL and several Atari XE cartridges (all of which say on the box "Also plays on all XE and XL computer systems". However, none of them seem to work. I tried one of my Atari 400 cartridges (Space Invaders) in the 600XL and it worked fine. Any ideas what the problem is? I know the XE Game System has 64K of RAM. Do I need to expand my 600XL up to 64K to get these cartridges to work?

I was under the impression that this core was written in ix86
assembler, which means that it would only have a chance of
fixing the problems on Intel architectures.

Ha! I covered my bases...just to be sure (and because I was bored and had the rental car for another day) I went back the next day and checked out 1196 Borregas across the street. They did have a rather interesting gazebo out behind 1196....can't remember what business is there now, maybe some insurance agency or something.

As far as the different Atari addresses, does anyone know the true scoop? Seems like 1195 Borregas was listed on most of the early 2600 documentation, but I've heard the 1196 address a few times too. I dunno what it was like when Atari occupied the premises, but it looks like 1195 Borregas was perhaps manufacturing and 1196 Borregas was corporate office?

Anyone know? Bueller? Bueller?

Most likely you need more RAM. But I did play Jungle Hunt on a 600XL once, so some should work. GATO for example is a larger than 16K game, so would probably not work. What titles did you try ? List them and I'll check as many as I can on my 600XL. Take Atarian care

The "V" bit is not set correctly for the ADC and the SBC commands. I sent the
corrected code to Petr, so he knows about this problem and got the fix.

My current DLI logic really counts cycles of the CPU, calculates the cycles
that are used by the various antic DMAs and the memory refresh, which is
sometimes dropped if things get just too tight. Unfortunately, there doesn't
seem to be a 100% complete documentation, so a bit guessing is required, too.

>Right now I'm writing some state-saving code, and looking into

Yes, that's possible. Pokey runs completely independent from the display
generation process, so the audio output can be adjusted at any time. However,
my current emulator core handles only pokey interrupts once per scan line
which has been good enough for almost everything except for software speech.
Everything else might be possible, but would be *tricky*.

Thanks for the tips! I've to admit that I haven't tried the sound buisness yet.
The only thing that happend so far is that I isolated my pokey emulation which
handles the interrupts and therefore allows relatively easy porting. There's
no /dev/dsp here for the SGI, but a /dev/audio. However, the /dev/audio is
really a very primitive beast.

Terry Ortman can't sue you. What is he going to do, take you to World
court? You are in Norway and he won't make the effort to travel there
to try and sue you.

Mr. Ortman has quite a reputation and if you search www.hotbot.com,
you'll find his fan club at:

http://www.ted.org/~cob/asshole/ortman/fanclub/index.html

Ron

3954. Thanks for all replies to my Terry Ortman question!

Not at all. The entire beauty of the Atari800 code is portability.
Various ports may try asm, but the actual source tree uses a C module
(the same one Thomas started with) as CPU emulation.

Hi Christian,

You could try writing the developer:

Change In Heat
12 Bella Vista Pl
Iowa City IA 52245-5840
USA
Developer: Pondering About Max's, 1 other game ???what???

If you do, let me know if you hear anything!

>Chris ..

It may not be quite that way.

I'm on the verge of cancelling my cross-format magazine (so this is not an advert) called 8BIT and refunding all the unused subscriptions after the current issue, which was due out Jan 1st 1998, and the next one (a grand final round-up) are done. So if you're still waiting for the mag, that's the latest and why I'm cross-posting this.

With 850+ subscribers I must have been doing something right, and it's always been on the right side of profitable, but pressures of a new business mean I *have to* give the thing that feeds the family priority in terms of time allocation. Perhaps these other guys have the same, or a similar, problem?

I'm still staying involved with the other 8-bit things I do, just not tying myself to the millstone (which it what it has become) of a publishing schedule because I hate being late as a publisher, and part of that is that I'd hate all the hassle of not *getting* a magazine to which I'd subscribed.

Actually, I can't hate it *that* much as I still put up with the heart-stopping surprise each time an issue of The Computer Journal arrives from the states, but you get my point (I hope).

It's quite true what some of the others have posted; staying in the <quote mode> older <end quote mode> formats support business is tough and hard to justify on any other grounds than for the love of the thing.

You can use unix2atr. It will create a DOS 2.5 or MyDOS disk image
based on the files in a Unix subdirectory. In theory, the program
should also work under DOS, but I haven't found anyone who is
interested in compiling it for DOS yet.

If you like to use subdirectories under MyDOS, you should really like
my program, as it is fully compatible with them.

Does anybody know of a device to program and run 7800 programs ? I have the Jaguar Server for the Atari Jaguar/Atari ST/Falcon/TT and wondered if any similiar device was available for this machine. I would love to start programming it :-) And also the 5200, that's very similiar to the Atari 8-bit, but there's games on it not available for the computer (I think anyway). One I can't seem to have seen anywhere is Space Dungeon and wondered how hard it would be to convert it to Atari 8-bit computer. Any memory maps available ? Are the Player/Missiles the same ? Or does it have more PM's ?

Thanks and take Atarian care

Ben Smith.
Ok, the thing is, a garage sale or flea market. You'rnot gonna find much Atari stuff at them. Bravo Sierra has Atari stuff, so you're most likely to find what you want there. He is reputable and sincere, and most importantly he is not a hit and run vendor. He's a serious vendor. And he PARTICIPATES in csa8. He answers people's questions, knowlegably, and participates in the discussions.

How powerful is the 800XL? I know its above the Atari 400 and 800, but
will it run most games?

>Does anyone have a copy of Temple of Apshai on Tape? Were there any add-ons for this game?<

GREAT GREAT game; this game got me started on RPG's.

Two additional add-ons (or sequels if you prefer) were released: Temple of Apshai: The Upper Reaches and (not sure of the exact title of this one) Curse of Apshai.

All were released later in a compilation package called "Temple of Apshai Trilogy".

Later, a cartridge Apshai game was released for the Atari 8bit and Colecovision: "Gateway to Apshai". Not as good as the original Apshai titles but a lot of fun anyway.

Al

The Atari 800Xl is one of the best Atari 8bit machines out there. Very expandable (so that answers your "powerful" question!) and it does run almost all Atari 8bit software (yes games!)

There are a handful of Atari 400/800 games that don't run properly but these too can run fine using a Translator disk (or equivalent).

And there are some games that only run on the XL/XE series as well!

Message-ID: <xRerz12.tandrews16@delphi.com>
Source record: 63553

I've been going to ask this for quite a while, but I just didn't get to it before now. Back when I was working on my income taxes, I tried to load Syncalc into my 130XE. (I wanted to do a sheet on my farm property taxes, breaking them down into deductable and non-deductable portions.) When I tried loading using my Indus drive, it took several tries through the sequence before it finally loaded. (I think it was around six.) Same thing with a US Doublered 1050, but when I switched my XF551 to drive 1 it loaded right in. This was the 130XE version of Syncalc.

Anybody know why this happened?

TJ

(I did get my taxes done ok. Even got a small refund...)

3986. Alley Cat & Seven Cities

Newsgroup: comp.sys.atari.8bit

Thanks are due to David and Rich and the others who have
done such an outstanding job with Atari800, and well as
the author(s) of XL-it. I am enjoying reliving my youth.
MULE, Spelunker, Archon, all great.

Has anyone had any luck getting either Alley Cat or
Seven Cities to run emulated? Which emulators were
successful? These are my two favorite games that I
have not yet been able to play again.

I have found one disk-based game (don't remember what it is though)
that won't work on the 800XL, but runs fine on a plain 800. When I
try to run it, I get a message saying 'Please remove cartridge from
system'; or something like that. Thing is, there wasn't a cartridge
plugged in. What I suspect is happening, is the program is seeing the
BASIC in ROM and thinking that there is a BASIC cartridge in the slot.

I have the following 7 Atari 8-bit computer carts for sale:

Miner 2049er - Big Five
Jumpman Junior - Epyx
Buck Rogers - Sega
Return of the Jedi: Death Star Battle - Parker Bros.
K-razy Kritters - CBS
Journey to the Planets - Roklan
Bug Hunt - Atari

All carts are clean and fully tested with labels intact.
The first person to respond to this ad can have them for $27 shipped via
Priority Mail.
I will ship the same day I receive payment. (US money-orders only, please.)
I have references on eBay for those that need them. Thanks for looking.

He's greedy too. Refuses to bargain as if he's a real store or
something, and my four $5 games ended up costing me $40 after he
overcharged me for postage and messed up the customs slip so I had to
pay an additional "handling" fee to Canadian customs. Im certainly not
buying from him again. The stuff I got looked like crap too, half of it
was ripped or crushed.

Source record: 63561

I'd like to know what your favorite Atari 8 bit computer games are.
I'm going to limit my list to my favorite 15. Feel free to list as many as you want.
Here are my picks...

15. Star Raiders...The first cartridge that I purchased along with my Atari 400. The salesman asked me if I wanted to feel like I was in charge of the Enterprise. He sure knew how to press my buttons. I can't tell you how many hours I spent playing this in my room with the lights off and the TV's brightness way down so all I could see was the screen. I'm getting chills thinking about it.

14. Defender...Remember how awesome you thought your Atari computer was when this came out? I still remember the look of shock and disbelief as I showed this off to my 7th grade buddies at lunch-time. Everybody else that I knew only had a 2600. We often never made it back to school after lunch break.

13. Choplifter! (Broderbund version)...Man, was this game ahead of it's time or what? I was so amazed at the little hostages waving at me! The gameplay in this one is rock-solid to this day. I only recently rescued all 64 hostages for the first time! I still play this one a lot.

12. Archon...I would sleep over my friend's house in the next building and bring only this cart and my 800xl. We would get so excited that his father would frequently have to come into the room and tell us to keep quiet. The first game that I can remember breaking night over. Damn, Electronic Arts...How about an update?

11. Jumpman Junior...Another game that I play frequently. No matter how good you get at this game, it will always surprise you with some random element. No two games are ever alike. Wicked level design.

10. Mountain King...That music! That insane, hectic music! I didn't know back then that it was actually a classical piece. Now that I'm older, it seems crazy that they designed a whole game's storyline around a piece of music, but it worked really well in this case! I still remember the TV commercials for this one.

9. Miner 2049er...Are we noticing a pattern here? Jumpman Junior, Mountain King, Miner 2049er. I guess I've always loved platform games, even before the phrase was used to describe the genre. If you typed in Big Five's telephone number, which is on the title screen, you could hold shift and then press a number key and it would warp you to that level! Try it...I promise you that it works! A timeless classic. (I never did get to play Bounty Bob Strikes Back. I heard it was an even better game than the original!)

8. Gateway To Apshai...I can't remember if this was my first RPG or Intellivision's Advanced Dungeons & Dragons. (Not including Atari 2600 Adventure.) Whatever the case, this is the one that I have fondest memories of. The terror of being chased into a dead-end by a stone golem is one you won't soon forget!

7. Fort Apocalypse...Obviously inspired by Choplifter, but taken to a whole other level. The inclusion of underground caverns, timed doors and your constant fight with gravity made this one nerve-racking action game. I only recently was able to finally track down a copy. I think this was the last game that I needed to have every cart that I owned as a child. (Thanks, Alex!)

6. Ms. Pac-Man...Infinitely replayable to this very day. Probably one of the greatest videogames ever designed. I think I have a copy of this game for just about every system it's available for. (Can you tell that I LOVE this game?)

5. Caverns Of Mars...My first experience with this game was a copied audiotape that a friend made for me when I got my 410 program recorder. The tape had about 25 games on it including Preppie!, Protector II and Space Invaders, but Caverns Of Mars is the game that I kept playing. I still remember that to load this game, the tape counter number was 146. All you had to do back then to make a copy was throw a tape into a double cassette boom-box! (I was young...I wouldn't pirate games nowadays.) This game would get really freaking hard!

4. Wizard Of Wor...So much fun with 2 players! The game would always start with me and my best friend trying to cooperate and clear many levels, but it would always escalate into a death-match! This was a really nice conversion of the coin-op.

3. Asteroids...Ever play this with 4 players at once? Pure insanity! There are so many different ways to play this one that I just had to include it.

2. Donkey Kong...Man, did I love rubbing this game in all the faces of those Colecovision brats who swore they had an arcade-perfect version of the game. The Atari 400 version had all 4 levels, the little 100 point graphic when you jumped a barrel, the "How high can you get?" intro screen, the girl yelling "Help!" and a ton of other little touches that made it much closer to the arcade version than the Colecovision port. (Not to mention that it was FAST! Really fast. Almost like a "Donkey Kong Turbo" if you will.)

1. Shamus...My love for this game knows no bounds. This was the first cartridge that I went looking for when I got back into collecting Atari 8-bit games. From the Alfred Hitchcock theme to the 127 room layout...this game had me in awe the first time I layed eyes on it. I used to draw the Shamus robot in my school notebook at least once a day. The action is this game is so intense...it was miles above anything out at the time, and so original. The main character's design is so cool that he should definately be updated for a modern remake. (I heard the game's programmer, William Mataga, is now a woman. Anybody else hear about this?) This game still invokes the feelings in me that I felt playing it when I was 13. All the elements in this game come together to create such a wonderful feeling in me that I can't even describe it. (I know...I'm getting carried away but it's late.)

There you have it. My top 15 Atari 8-bit computer games of all-time. I only included cartridge games because I don't own a cassette or disk-drive and I don't have that strong a memory of a lot of those games, otherwise I'm sure I would have included Bruce Lee, any Infocom or Scott Adam's adventure games, Starbowl Football, Shamus: Case II and probably a dozen other titles that I can't remember. It's really late now, (3:40 am) and I'm sure I'll regret leaving out 1 or 2 titles that I'll remember as soon as I send this message. Anyway, I hope you enjoyed reading about my fond memories of what I think are some of the greatest games ever made. Please follow up this thread with your own memories, as I would love to read them. I'm only posting this to this one newsgroup, because I feel the people here are mature and can contribute something intelligent that I would enjoy myself. Sorry for the length of this...I just couldn't stop once I got going. Take care.

-Scott Wozniak

4003. Update on ramdrv10.arc

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-24 00:00:00 UTC
From: rje@co.umist.ac.uk
Message-ID: <RJE.98Apr24120804@co.umist.ac.uk>
Source record: 63565

Hi all,
For anyone who's interested, I've fixed the problem with the ramdrv10.arc file on my web page. The problem only appears if downloaded to a DOS/Windows machine, downloading to other machines (Mac, Unix,...) should have been OK. Turns out there was a problem with the MIME type settings at this end, and the .arc extension was not being recognised as a binary file, this meant that the file was being saved in text mode, which on DOS/Windows means converting CR's to CR/LF's thus messing up the .arc file. This also means that the copy up on the archives is OK (phew!).

I've renamed the file on my webpage to be ramdrv10.arc.bin so that it is now recognised as a binary file, it is still an arc file, so get rid of the .bin extender when saving it. If anyone has tried to download this file in the past and not been able to unarc it, then give it another go now. Thanks for the info Mathy =)

On a related note version 1.1 of Ramdrive is now in the works, its going to be smaller (meaning less disk space, and shorter loading times) and fix a couple of bugs. So has anyone bothered using version 1.0? Anyone found any bugs in it? I've found 2 minor ones (listed on my web page) plus I think there's a problem with 512 and 1024 byte sectors (but I've not fully tested those). So if anyone has any comments, suggestions or bug reports, now would be a good time =)

Also I'd like to compile a list of systems that it works under. Something along the lines of machine type, expasion type (if known), expasion size and DOS type. So far I've tried it on a 320K and 1088K 130XE, with DOS 2.0, DOS 2.5, DOS 3.0, MyDOS 4.50, MyDOS 4.53/4 and DOS II+, and on a stock 64K 800XL. Anyone tried in on any other systems and or DOS's? Anyone tried it under Sparta X configured not to use the RAM under the OS?

> Anybody know why this happened?

Ya, that version had some incredible copy protection schemes,
including one that forced sio to error out, if the correct error
wasn't returned then the boot process was aborted. I know a
couple of hackers that worked on that one for several weeks and
finally concluded that Synapse deserved to be payed for it just
because of the copy protection, that was years ago, but
never the less.......

Still looking for games (especially cart's) for the Atari 8bit.

Would like to Thank all those that replied to my earlier post and am enjoying the games I've purchased.

If you have any game carts for the Atari 8bit, please send me an Email at "ComDungeon@aol.com" with a list of what you have along with asking price.

Am also still looking for the SpartaDOS X cart and Alternate Reality: City & Dungeon on disk.

Thanks for taking the time to read this and I look forward to hearing from you.

It will run most games. There was a disk from Atari that would boot it up to act like an 800 for those games which required the original. (Don't remember the disk name, but it originally cost about $15 US.) Excellent system.

I remember having an Atari 400 computer when I was little. I was recently looking at sites that had pictures of the 400 and I found that next to it was a peripheral that looked like a tape recorder. What was this? I also remember when I went to buy games for the 400 there were audio cassettes for it. Can someone help explain what these were. Your help would be greatly appreciated.

4013. Re: Atari 800XL

Source record: 63575

> How powerful is the 800XL? I know its above the Atari 400 and 800, but
> will it run most games?

It's not a question of power, but compatibility. The processor on all Atari 8 bit computers is basically the same. The 800XL has 64K of memory. Since most 8bit atari software can't use more than 48K of memory, the 800XL is fine. Only the 130XE had more memory. However, it was possible to expand the 800XL to 128K. I used to have one that was expanded to 128K and AtariWriter Plus was the only program I had that could take advantage of it.

Most games run fine on the 800XL. There were some changes in the OS between the 400/800 and the XL series that caused some programs to not run correctly (or at all) on the XLs. There was a translator disk available. It was 2 sided. One side worked with 90% of software incompatibility problems. The other side worked on about 8% of the cases, and a very few cases, the program just wouldn't work on an XL at all. I recall having one game that would run fine on my 800, but wouldn't run on the 800XL at all.

A friend who was the Atari service guy at a computer store in Tulsa, OK modified his 800XL using the ROMs out of a dead 800 to create an 800XL where the 800 ROMs could be switched on, so that the machine basically became an 800. (Obviously, you had to power it off before toggling the switch.) It was pretty cool.

There were also some games written that ran on the XLs which didn't run on the 400/800. I believe that the XE was totally compatible with the XL. I think the main difference between an 800XL and say a 65 XE was the plastic. Obviously, the 130XE had more memory.

As I recall there were a couple of other problems/complaints about the 800XL:
- people didn't like having only two joystick ports because they couldn't play 4 player games like M.U.L.E.
- some of the early MPP products (they made a printer interface and a modem -- colored bright blue) used the 3rd and 4th joystick ports. Therefore, they don't work with the 800XL. Later versions of these products worked fine with the 800XL. I recall that I had a MPP printer interface that used the third joystick port on my Atari 400. Later I bought an 800XL and an MPP modem (the later design) that used the second joystick port. That was fine since there weren't very many times you would want to use the modem and have two joysticks connected at once.

Brant Sears
bsears@physix.com

The 800XL was way cool.

Here's some of my favs (in no particular order
except for Spelunker, which was probably my favorite):

- Spelunker
- Jumpman (and Jr.)
- Miner 2049er
- Ollie's Follies
- Donkey Kong
- Montezuma's Revenge
- Ballblaster
- Shamus
- Pharaoh's Curse

There were many others I can't think of right
now. And I, too, was heavily into platform games.

God, I wish someone would come out with a
new Spelunker game for the PC/N64/whatever.
This would be so cool. I'd also love the
ability to edit the original maps.

Has anyone gotten Pharaoh's Curse to work
on any emulator (Atari, C64, etc.)?

> Adventure.) Whatever the case, this is the one that I have fondest memories of.
> The terror of being chased into a dead-end by a stone golem is one you won't
> soon forget!

Scott, this is one game I still play to this day. This game still scares the sh-- out of me.
I love it. I used to have nightmares of "CHIEF THIEF" and "ASPS' running after me! I still hear that freaggin' noise when you'd spring a trap on one of the treasures by accident.

Archon forget about it, my parents would have to break up massive fights between my brother and I!

Another cool game that was way ahead of its time was Raid Over Moscow, I have many fond memories of shooting the soldiers off the sides of the wall, that was fun!

Pharoahs Curse and Montezuma's Revenge were the best. I've still yet not seen games with such great playability. All that you needed was a joystick back then and you were on your way. You didn't have to study books,manuals and know a million different functions on your keyboard in order to play and have a great time

with the games! I miss that.

Thanks for the great post, to me this is what it's all about.

-Rich.

Message-ID: <35419075.7478@mediaone.net>
Source record: 63490

I'm having a problem running a Super Zaxxon .atr image, I'm using Ape and I've tried different menu loaders, mydos, hitting "reset", and different 8-bits. This is one of the few images I have any difficulty whatsoever with.

Does anyone have a "working" image and "how" did you get it to run?

Any help would be appreciated alot,

-Rich.

4028. FS: Activision Patches

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-25 00:00:00 UTC
From: Tom Ciccone <TomCiccone@worldnet.att.net>
Message-ID: <6hrqt8$2np@bgtnsc03.worldnet.att.net>
Source record: 63491

I have the some Activision Game patches for sale. Activision used to send these to people who took pictures of their screens after aquiring a certain score as dictated in the instructions for each of their 2600 games. These are extremely rare (especially this complete of a collection.) These are iron-on patches that have never been used. All are in mint or new condition. I have included the game title where known, unless it is obvious by the patch's name:

Billy Club (For Keystone Kapers)
Chopper Commanos (For Chopper Command)
Commander (For Laser Blast) I have 2 of these
1,000,000 (For Laser Blast) I have 2 of these
Order of the H.E.R.O. (For HERO)
Bucket Brigade (for Kaboom)
Roadbusters (Enduro)
Secret Society of Dolphins (Sea Quest?)
Friends of Dolphins (I have 2)
River Raiders
Explorer's Club (Pitfall) I have 2 types
Bronze
Silver
Gold (Decathalon)
Tennis
No Plaque Pack (Plaque Attack)
Crackpots
Save The Chicken Foundation (Chicken)
Grand Prix Driving Team
Trailblazers
Trail Drive
Ski Team
Dreadnaught Destroyer
Frostbite Bailey's Arctic Arcitects (Frostbite)
Cliff Hangers (Pitfall II)
World Class Dragster Club
Megamaniacs
Super Sleuth
The Worm Whompers
Spider Fighters
Beamriders
Flying Aces (Barnstorming)
Sky Stars
Oinkers
All Star Hockey Team
Star of Honor

Medal of Merit
Cross os Excellence
Supreme Starmaster (2)
Starmaster (2)
Wing Commander (Starmaster)
Leader (Starmaster)

I am the original owner of all of these. I have kept them since I received them as a child from Activision. I can't even remember the names of all of the games that they apply to. Serious inquiries only. I am willing to trade for Atari 8bit computer stuff and will gladly accept checks (won't ship till they clear) or money orders (will ship upon receipt). Please don't send anything until we have agreed upon a price. I will pay all shipping if these are all purchased by one person. Please e-mail me with any questions and offers and I will respond. Please make offers in US funds only.

Tom

Well, the tape recorder you saw was a tape recorder. The 400/800/etc.
series of computers, as well as a great many others, could store programs on
casette, much like a tape drive.

If you're interested, come take a look.

Description

Here is the Atari XE system, it consists of a Game Deck, attachable Keyboard, Light Gun, and power supply. Also comes with Pole Position. Does not come with joysticks or T.V. connector, but the connection looks generic. Winning bidder pays shipping, you choose the method. GOOD LUCK!!

I really couldn't believe this flame and a couple of other lamers
sticking in their 2 cents. In a market where Atari dealers are
becoming a rarity these assholes would like one less. Ben Smith has
been providing a welcome service to the Atari community for a long
time and unlike the Terry Ortons of this genre has generated few
complaints. Maverick should stick his head in that volcano and blow it
out his asshole.
I just checked their web-pages and of course Dozer game players.
Likely don't even own an Atari other than a now-trendy 2600 and the
only reason they come on this thread is to see what they can rip off
from a real platform. My "fellow" Canadian from anal-retentive Toronto
which has NO outlets dealing in Atari peddles a "game" for Doze with
some of the worst graphics you could ever imagine. I know 8 year olds
who can do better. Go play Doom and leave Atarians alone you jackals.
We are quite happy with our "obsolete" equipment and dedicated
retailers who if they wanted to make big bucks would be selling
bloated overpriced games to jerks like you.

Those who forget history are doomed to repeat it.

>Thanx....Andy

Andy, I have EXACTLY what you described minus the disks! Unlike a lot of my other Atari 8-bit stuff, I happen to know which box in my basement it is in since I just looked at it about three days ago. I have the box and manuals. You can have it for whatever it costs me to ship to you, plus $5 for my time to do it. You may choose the method of shipping. Let me know what you think. I am sure you can find the software out there on an archive somewhere or something.

4033. Terry Ortman apology

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-25 00:00:00 UTC
From: "Vidar \"Hawk\" Olavesen" <olavese@online.no>
Message-ID: <01bd7034$21aae4a0$20374382@vidar>
Source record: 63496
Cross-posted to: alt.atari.2600vcs,alt.atari-jaguar.discussion,alt.games.video.classic,comp.sys.atari.8bit,rec.games.video.atari,rec.games.video.classic

I did get some of the things we agreed on, so I would like to apologize to Terry Ortman and I have taken him off my bad trader list.

However, I would like to point out that I sent the money in February and asked him on March the 4th, 9th and 10th about the package and payment. He didn't reply until 04/21-98 and that was with a threat of a lawsuit because I put him on a bad trader list. He states in a later email that he doesn't check emails more than once a week, but there's plenty of weeks between 03/04-98 and 04/21-98, so I think he should have replied. After the latest threat on the 04/22-98 I tried yet again to email him to enquire about the post office the package was sent from. I haven't heard anything yet.

How long does a money order take to clear ? Can anybody who has got a money order from me, tell me ? I think there's no clearance time on it and even cheques don't take months to clear.

But, I did take him off the list and I hereby apologize to Terry Ortman.

But, I would appreciate to get the whole package we agreed on, as I only got one disk with no assemblers any of the disks Terry said was included

> Any ideas?

Your ATARI800.EXE file is corrupted. COFF is a unix type executable, and the ATARI800.EXE file's header has obviously detected that the file it's running is not a proper COFF file. Anyway, try downloading the file again from a different location.

I actually have an Atari 800 emulator for my Atari XE. Don't know if it's
the same as the one you mentioned, but it would boot up my XE as an 800.
With the built-in notepad and everything. It would most likely run with the
XL too.

Ahhh... favorite 8bit games. So many to pick from. I'll try with five.

5) Crush, Crumble, Stomp - great game where you designed your own monster and had to destroy as much of a city as you could before the army and scientists destroyed you. Can't recall HOW many hours I played this game, but it was alot!

4) Temple of Apshai Trilogy - my first role playing game and I was hooked the minute I booted it up. Looking for secret rooms, avoiding monsters, and even killing a giant chicken now and then. Gaming couldnt' get much better than this, could it?

3) Jumpman & Jumpman Jr. - level designs made both of these games FANTASTIC fun. I still remember one level of Jumpman where the structure would collapse as you walked around on it. Mean spirited that author was!!

2) Star Raiders - this game made me purchase my first computer: an Atari 800 with 810 tape drive (because I couldn't afford the additional $600 for a disk drive). Remember going into the store and seeing Star Raiders for the first time; don't know how many times the salesman told me I would have to stop playing now. I couldn't so I bought one!

1) Miner 2049er - still LOVE this game big time. Simple graphics but GREAT gameplay. Level designs that kept me up until the very early hours of the morn to "Just one more try".

Could name so many more: Shamus, Shamus: Case II, Pharoah's Curse, Star Warrior, Pirates of the Barbary Coast, ...

8bit gaming... that was fun!

Al

-> is, there wasn't a cartridge plugged in.

Press the <OPTION> key when you turn the computer on. Otherwise
the XL loads the internal BASIC (like having a cartridge plugged in
on the 800).

You got SOME of the things you ordered? Months later? Why are you
apologizing to this jerk? Money orders are not checks since they are
already paid for and don't need to clear.
Go to deja news and do a search on this guy, you'll find "fan club"
(not in a good way) web sites set up just for him. Visit these web
sites, you'll laugh for hours at all the law suits this guy claims to
have. If it moves he'll slap a lawsuit on it.
He's on my "bad trader list" list. Lets see if I get sued now.

(Olavsen apologizes to T. Ortman.)
I'm ashamed you got involved with Ortman. He has a reputation
in this group going back years. I certainly don't think that
receipt of an aparently very small part of your order, which
you paid for 3 months ago, is reason to take him off your
bad trader list. TERRY ORTMAN HAS A REPUTATION AS A BAD
TRADER. This is widely know in csa8 and elsewhere.
I'm only sorry someone didn't warn people after the post
he made that got you hooked. Usually, after one of
T. Ortman's posts, somebody posts a warning.

"As far as the different Atari addresses, does anyone know the true scoop?"

I don't know the exact address, but for some reason, the street name stuck in my head. In late 1996, when I was in San Jose on business (and had a rental car), I, too, made the trek over to the old Atari HQ. I don't remember what the number was, but the building was on the corner. I know for certain that it was the right building because there was a sign out front, which had just had the Atari name removed. It was quite sad and I took a photo or two. (Whoa, what non-computer types must think of us! Heh heh...)

Here are some of my favorites (in no particular order):

Star Raiders--Saw it in a store and after picking my jaw up off the floor bought my first Atari (400). (This seems to be a common experience. :-)

BallBlazer--Great 2-player game. Simple concept, slick graphics and gameplay.

Wayout--A mezmerizing game--I would completely lose track of time wandering around those mazes. After a while I didn't need the map or compass and told that Kleptangle where to go :-)

Alibaba--The only role-playing game I ever got into--and finished. My favorite feature was the way you could control any number of characters.

Joust--Always liked the illusion of gravity and inertia and how you could use it to anticipate things. Almost a physical game.

Defender--My favorite shoot-em-up. There was no magic path to follow, your were just dropped into the middle of a snake pit with no time to think. Pure adreneline rush.

Deluxe Invadere--The arcade version of Space Invaders was the first video game I ever got hooked on. This version is very faithful--all the same strategies work.

Rescue on Fractalus--A fun game with stunning graphics. Bumped into the guy who wrote it (David Fox) at a Siggraph show years ago (he also wrote a great book on Atari graphics and I recognized him from his photo on the back) and told him how much I liked the game. He was very modest--like it was no big deal. I think he's still doing games for Lucasfilm.

>
>

I'm a little surprised at you, Craig. I would have thought from our Genie days together that you were a bit more tolerant than that. Living with one's parents as an adult is not necessarily a sign of poor character. I'm a few months short of 49, and I still live with my parents - and I'm proud of it.

I suppose technically my parents live with me these days, since formal ownership of the home and a majority of the family business was transferred to me and one of my brothers a couple of years ago. But it makes little difference - my parents are not relegated to a subservient position in my life and work. I have more respect for them than that.

It was the same way between my parents and grandparents years ago. You see, before the family home and business belonged to my parents it belonged to my mother's parents. I grew up living with my grandparents. I'm much the better off for having the experience.

I suppose you'll say my situation is different from most. I'm a farmer. Extended families and generational succession is a tradition in my profession. But - farming isn't the only occupation where this might be true.

I'm not defending Mr. Ortman. I don't know him, and haven't had any dealings with him. All I know is what I read here, and little of that sounds good. However, to hold up the fact(?) that he lived with his parents as a sign of his lack of integrity is a slap in the face to all of those people who, like me, live with their parents while jealously guard a reputation of honor and integrity in all they try to do.

You can do better than that.

Back in the Dark Ages (pre 1982) disk drives were VERRRYYY expensive and many beginning computerists were offered a popular and lower cost alternative: Tape storage. Yep, you name an early 80s computer and you would find it had a tape (usually cassette style) storage unit, including the first IBM PCs, Apples, Radio Shacks, Commodores, etc.

Probably the coolest thing about the Atari tape format specifically was that the recorder had a stereo head on it and was able to load the program off of one 'data' track while playing audio through your T.V. from the other 'audio' track. (That was one of my collecting goals; to get States and Capitols, because of that nifty feature...)

The main bummers to tape are:
Not randomly accessible (i.e. the tape only searches and loads in one direction)
It is VERY slow (but alot quicker then keyboards or paper tape!)
When the tapes get 20 or so years old they snap really easy. (had to rescue some clessics from my PET tapes recently, had to re-thread one at least once.)

I can't really rank my favourite Atari games since I enjoyed (still enjoy) them all at one time.
I was bitten by the Pac-wave in the early eighties. I had a Pacman t-shirt (probably still have it somewher), Pacman toys etc. I also used to get the Pacman ice cream at the drive-in. I didn't have my own computer at that time, but my neighbour had a 2600, so I'd spend most of my time over at his house or at the arcade. Except the arcade version wasn't as "cool" as the 2600 version.
"Joust" would have to be the best two player game. I never really liked the two player games where you didn't play at the same time, so "Joust" was right up my street. I still play it quite a lot!
"Airball" definetly has the best gameplay. It sit for hours trying to find all the ingredients. Exploring the hundreds of rooms was a blast. And the music was so excellent, I couldn't believe my little Atari was generating it.
"Centipede" was always a hit. "Millipede" was OK, but "Centipede" had more charm in some way.
Out of the newer games, I really enjoyed "Blinky's Scary School". The graphics and music are excellent!
"Crystal Castles" also brings back memories. I remember going to the computer store and asking for Pacman for my Dad's Atari ST. They ended up selling me a copy of "Crystal Castles" and my brother and I were so attached to that game, we ended up getting the cartridge for the XE.
These are all the games I can think of at the moment. Only got my Atari XE, XF551 and XC12 down from the attic again a couple of weeks ago after finding this newsgroup.

I'd like to download some files from the u-mich archive, but I currently don't have a way of saving them in an Atari format on my PC. Is there software for the pc that will save files in Atari format on my 5 1/4" drive so I can then take it to my stock 1050 and load it into my 800xl/130xe??

Or will I need an sio2pc cable??

Funny, I didn't own any carts when I was a kid. Everything was on disks and loaded into the Indus GT disk drive. Here is my list:

1. Boulderdash (Tied w/Bruce Lee)
1. Bruce Lee (when the Sumo Wrestler Yawned, the game owned me)
2. Zorro
3. Conan (As you can see, I really like DataSoft Co.)
4. Necromancer (This was the fastest paced game I had ever seen)
5. Summer Games
6. Zeppelin (Just what was the purpose. I never won it.
7. The Last Starfighter
8. Spelunker Never won it.
9. Caverns of Khafka I could not win it.

As you can see, I really liked the games that I could not conquer. Plus, DataSoft included so much animation and story to their games that I feel there was no other company that even compared. To me, they were to the 8 bit what Activision was to the 2600.

There you have it. I traded the 800XL, Indus GT and all of the games and accessories for a pair of 12" wide Centerline Mags for my Trans Am when I was 17. Dumbest thing I ever did, except at the time, the mags made my car look cool...

Hi group

just posted here to find out what is the best 8 bit emulator available, ive heard of XL-IT but have no information or web page to get it from

also any links to image files for the software

how is the image file used, is this similar to PaCifiST files

are the image files single games/applications or are there many in one file

Regards

Hello I'm looking for the following games for the 8-bit atari:

Mystery House
Wizard and The Princess
Mission:Asteroid
Cranston Manor
Ulysses and The Golden Fleece
Time Zone
The Dark Crystal
Suspended
Starcross
Ultima 1 (would take just the box and/or manual for this one)
Ultima 2

I have games to trade and Waterworld prototype and Shuttle Oribiter 2600 carts.

Thanks,
Tom

A couple more 8bit games that I believe are excellent:

Oils Well - great game with very well done level designs. My wife always griped when I started this one up because "I won't hear from you for days"; possibly the greatest "Just one more try..." games ever made.

Alternate Reality: City & Dungeon - Temple of Apshai started me on the RPG craze but both these titles had me hooked for months and months. And what was better was that my wife and I played them together: one mapping while the other did battles and handled controls (we switched off frequently) while putting our heads together on strategy and puzzle solving. GREAT GAMES!

While I listed games before in an order of 1-5, I can't really say what my top five are as there are just too many fantastic 8bit games.

And notice I said "are" as I believe most 8bit games are as fun and playable today as they were when they first came out.

No button mashing, finger contorting games, 3D Accelerator required games here.. these are just FUN games!

Al

Hi there! I read your 8bit game post and it brought back good childhood
memories. Asteroids with 4 players is a HOOT.. played that a friends
house just a couple years ago. ASteroids, Beer and some of the amazing
little features of that 8K ROm (like TEAMS, every man for himself,
hyperspace, etc) sure guaranteed a great time)

They just dont make 'em like they used too! heh I noticed you missed out
on alot of the newer (?) 8bit games.. like Zybex, Draconus, etc. But the
classic can't be beat. I always loved DIG DUG.. (that was my firsty 8bit
ROM on my Atari 400... costed my Aunt and Uncle $65 way back in 198? (it
was so long ago I forgot!)

Man, that little Atari 400 had character....

Money orders usually clear some day. (Well they do at most Canadian
banks) A personal cheque is another problem. It took anywhere from 21
days to 45 days for a U.S. personal cheque to clear at my Toronto bank)

I know this is ridiculous, as I have family that used to work at a bank
and told me foreign cheques only take about 5 business days to clear, but
the rest of the time is bureaucracy red-tape stuff.

But I agree with your points. Anyone who does Internet trading, SHOULD
check their e-mail often! A dissatisifed customer is a threat to future
business and bad trading shows poor moral character IMHO. But as they
say, caveat emptor - buyer beware!

Maybe we should establish a code of conduct for trading in this base?
Perhaps post it on your homepage? Maybe some rules we all can agree on,
perhaps to build on your good/bad trader list idea. What do you guys
think?

Yes, DRUID now that was a game and a half? Did you ever complete it? I got several of the cool spells but I was never good enough to win that game. I guess I just didn't play enough! heh. But what about these other games? LineUp, operation blood, deimos, etc? never heard of those? Can you provide some info on these games? like release year, grafx, game play? (I officially got out of the 8bit world in June '94, but I still kept an 800Xl and an Xf551 and all my 8bit ROMs/disks for Atari emergencies!)

Yeah, I never played any of those because my PC isn't fast enough to run decent emulations and I only collect cartridges for my Atari 8 bit computers. (So I don't get to play any disk-based games.) I was thinking about trying that APE thing, though. A lot of great disk-based games didn't make my list simply because I either don't remember them that well or if I do remember them, I would only want to include something that I would still play now...and since I don't have a disk drive, well...you get the point. I'm sure that if I had the chance to play them now, I would still love M.U.L.E, Hard-Hat Mack (was that for the Atari or am I remembering the Apple or C-64 version?) Bruce Lee, Spy Vs. Spy......so many great games. Thanks for everyone that responded to this post. You have some great memories. Let's try to keep this thread going a little longer...C'mon people.....Let's hear about your favorite 8-bit memories!

4071. going out of Atari sale

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-26 00:00:00 UTC
From: slycy@geocities.com
Message-ID: <6i0k58$577$1@nnrp1.dejanews.com>
Source record: 63531

Buy me out! Sadly, I don't have time for all this stuff anymore :(

Give me your best offer!

I have the following Atari items for sale AS A LOT ONLY. I will not break this up since I do not have the time to sell items individually, as I had earlier hoped. I will be taking offers until the end of May, or if someone comes up with a really good offer before then. If you don't know how much this stuff is currently worth (perhaps if you want to re-sell pieces yourself), here is what I believe are conservative values: Books - $100, Mags - $100, Carts ~ $50, Hardware - $few hundred. If you sold what you did not want piecemeal (sp?), my guess is you will make alot more than those estimates.

I am located near Austin, Texas.

Buyer Pays shipping.

4072. A FOCUS ON EUROPEAN GAMES - INTRODUCTION

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-26 00:00:00 UTC
From: jmouchmino@aol.com
Message-ID: <1998042623124200.TAA06638@ladder01.news.aol.com>
Source record: 63532

I agree with all of you: you can't beat the American classics!

Actually, most of my favorite games are US productions: Bruce Lee, Mr. Do!, Pole Position, Alternate Reality, Infocom adventures, Ultima series, Lode Runner, Star Raiders series, Spelunker, Montezuma's Revenge, Boulder Dash series, Drol, Spy Vs. Spy series, Ballblazer and the list goes on and on, but...

Although the Atari 8-bit computers were never vastly supported by European software houses, MANY great games appeared in the UK, Germany, Slovakia, the Czech Republic and Poland in the past 14 years or so.

As a number of people may only be familiar with classic pre-86 software from the States, I decided (well, actually, Alan of Toronto gave me the idea!) to write about what you could be missing!

In the coming days (weeks?), you will be seeing a fairly accurate alphabetical list (in several parts, of course!) of the best - and worst - games written in Europe for the Atari 8-bit; they will be described very briefly and given grades for graphics, animation, sound and overall value (gameplay).

The following things must be considered:

1. Some European games may not work on NTSC Ataris; the best thing to do is to "upgrade" to a PAL chip (note that ALL games from the States work on a European PAL computer).

2. I don't know how the games behave with emulators (it seems a lot of European software written after 1990 doesn't run properly, if at all).

3. Only commercial games or "commercial quality" public domain software will be reviewed.

4. The reviews will only reflect my gaming experience.

I hope you find this an informative and useful guide for your hobby!

See you soon for the first part of the reviews!

Atarily,
Bertrand.

Source record: 63534

I have had no dealings with Terry Ortman, but I recall he posts an advertisement for overpriced Atari 8bit equipment here about 3 times a year. The same ad over and over...

The universally hostile condemnation of Terry Ortman sans details makes me think he probably did something right.

vs

4075. 8bit Game..What was the name??

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-27 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <1998042700013200.UAA12126@ladder01.news.aol.com>
Source record: 63388

In talking about favorite 8bit games, I just thought of one that I used to play quite a bit but can't recall the name.

In it, you were in an arcade (I believe) and you ran around picking up tokens. Two enemies would chase you but you could use the tokens in various ways to delay your being captured. For example, if you dropped a token (or more) into a juke box, music would play and the enemies stopped chasing you to dance. If you went to a pay phone and used the tokens, then they would stop chasing you and run to another pay phone to answer the call.

The company that made the game was Broderbund I believe.

This game sound familiar?

Al

4076. Re: Atari 7800 Asteroids

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-27 00:00:00 UTC
From: guy1015@aol.com
Message-ID: <1998042704555200.AAA12380@ladder01.news.aol.com>
Source record: 63389

The 7800 version of asteroids is outstanding.. One of the best version of
asteroids ever, The LYNX has the other awesome version!! The Micro-soft
arcade is like the arcade version true emulation. There are a few realtine
Vector emulators on the net,
that emulate all the Atari Vector games and are great..
But 7800 and LYNX is the best.

Hello! Atarians!

The TAQUART group is proud to announce the opening of its new ftp-site,
where you can find almost all programs from our previous site
(yoshi.meil.pw.edu.pl), which was closed. Site is open 24h a day, has a quite
good link, so you shouldn't complain about the transfer rate ;-)

Here comes the info:

matrix.ibb.waw.pl has address 148.81.193.9

ftp://matrix.ibb.waw.pl/pub/a8

P.s.
This site is under construction, so don't worry you can't get into some
directories (Groups, New)...

P.P.s.
If any of you has a backup of DEMOS-files from yoshi.meil.pw.edu.pl, please
contact us... (slawek@gaja.ipan.lublin.pl)

Short grtx to:

- the rest of TQA
- Slight ( P.W., Seban, X-Ray, Rzog, Soused Teat )
- Tight ( Waldi, Gumi, Vidol )
- Cobra ( Chris )
- Our 5oft ( Pirx, Chillz? )
- Draco
- Quasimodos ( Kroger )
```

- Shadows (Titus)
- Hard (Tamas)
- Abbuc
- Excellent (Kuchara, Wodz, Josh)
- Aids (Mateoos)
- AR (Miker)
- Mith
- ...

>
> Or will I need an sio2pc cable??

Stephen,
I believe ther program UTIL.EXE will do this, but your floppy drive
must be 360K only. The much better solution is the SIO2PC cable and the
Atari peripheral Emulator (A.P.E.) software. Get the 1 chip SIO2PC
cable. It's suppose to be better. This way you can d/l file from any
web/FTP site and put it directly to an Atari floppy on the 8-bit system.
This system also allows you to use your PC as a very large bootable hard
drive for you 8-bit system. Definitely worth the investment in the cable
and program!!!

Nigle,
It's hard to say which is "the best" emulator. Your best bet is to get
as many of them as you can and try each one for yourself. Each one has
its strengths and weaknesses. Also try each one in as many
configurations as you can to determine which one will run YOUR stuff
best in most cases. Different DOSes and emulation modes work differently
with different programs, so before you can say that a certain emulator
doesn't actuall run you progran, try a different mode and/or DOS.
Good luck!

This is in Texas, so perhaps other states differ, but:

Just to clarify, a money order is *not* as good as cash at a bank. I worked for a bank for a number of years, and people often make this mistake and get really upset when we don't treat it that way. Yes, a money order must ostensibly be purchased with cash or guaranteed funds, but a bank is under no obligation to cash it for you if you don't have an account at said bank. In fact most banks will not do this, unless they have some sort of general check cashing service for non account holders (and they usually charge 1% for such a service). The bank for which I worked did *not* cash any money order if you didn't have an account, except those MO's issued by us. Technically speaking, there is a time for a money order to clear. It's simply that most banks will give next day credit to your account, or cash it on the spot (for account holders), because it is extremely unlikely that there will be any sort of problem with a money order (barring forgeries).

This is a minor point, but I was yelled at enough by rude customers who simply couldn't grasp this. I just wanted to make this clear, before anyone chews out their local financial institution because you think "a money order is just like cash". Only *cash* is like cash.

Thanks, Alex.

Darn, was hoping the name was Steve..

As for a list of favorite 8-bit titles, no list can be complete without including 7 Cities of Gold. Man, I remember too many nights of me and a couple of friends exploring the new world with this one.

A PC version came out back in '92 or '93, but it had become too "Politically Correct" and so lost some of the fun.

If you want to see what the front of Atari H.Q. and you have access to a Atari Jaguar+CD unit and the game MYST go to the planetarium and sit in the chair and put in the date May 20, 1970 6:30 am on the computer above you. Then go to the library and face it there you will see the front of Atari, then look up and you will see the programmers.

Have a great Atari day,

1) I have added about 5 more of my programs to the download section.

2) I added an "Alert Me" feature to the site. If you want to be alerted when the site changes leave your name and e-mail address at the prompt. :-)

I mentioned in the last paragraph of my intro on the site about releasing source code and received a lot of responses on that account, I am thinking about the best way to do it and include some of the included Action! routines that I have written over the years and see if I can make that available---hopefully with tips and tricks on how you can adopt them to your programs.

TTL,

Nelson

Is it from an 8-bit computer or an ST? In either case, your best bet is
to recreate the exact configuration of computer, adapters, and operating
system, or find someone who has a similar system.

Source record: 63414

I have a very large collection of Atari 800 hardware and software for sale.

The collection is to large to inventory completely, but as far as software
is concerned, if it was made for the Atari 800 it is probably in this collection. Below is a list of some of the main items of this collection.

1 - Atari 800 computer
1 - Atari 800XL computer
2 - Happy Drive modified 810 Disk Drives
1 - 810 Regular Disk Drive
1 - Atari Touch Tablet
1 - Atari 850 Interface
2 - 410 Tape Drives
50 - Tapes for Tape Drive
Over 1000 5 1/4" diskettes with probably over 2000 software titles, most of these titles include instructions (either original or photocopied)
Over 30 Books (either original or photocopied)
Assorted Cables, wires, power supplies and joy sticks
Other miscellaneous items

I am looking for best offer for the lot. I live on Long Island, New York and would prefer someone who could pick up the collection instead of shipping it. If you live outside this area, your offer should be for the collection. The shipping will be extra. This collection fills about 10 large boxes.

Please email responses to dpfonts@concentric.net, I do not read this newsgroup.

Hello DarkChyld, I recognize you as buying from me before.

When Howard said I act like I'm a store. Actually Atari is what I do. As far as stores, their's less and less of them around. Their was a registered Atari Dealer here in Portland, but their gone. I didn't wan't to do business with Howard, he came to me with a list of what he wanted, told me what he wanted to pay, not what they were listed in my catalog for. I told him no, but he still came back. He pretty much decided he wasn't going to be a happy customer. Still he wanted me to send it surface mail, but I sent it air mail. Still, he wasnt happy.

Thank You, Dark Chyld.

>> > Thanks...

This is the Superram 320K XE upgrade.
KThis upgrade is "XE" compatible. MYDOS 4.5 will support is. I've used it
for years. Just configure the ramdisk as "XE" and "192" K(the default. It will
work.
As for other software, Anything else that supports up to 256K of XE type ram
should work. Paperclip gives me 240K free. BASIC XE will use 64K of it if
desired.
Under O.S. stuff is not affected.

(Guy from Norway, I think, re: money order.)
This was international. There's a international money order
or something. I'm sure international people know what I'm
talking about (I mean a European money order or something).
Our US get a money order at the local grocery store may
not be familiar to European banks and post offices. The
Norwegian equivalent may not be recognizable here.
International orders do present a bit of a problem.
Our friends in UK (DGS? , others), generally seem
to prefer cash in an envelope, as US cash seems to
work in the UK.
I dunno.
Still T. Ortman threatens the guy. And only send part
of the order. The guy still has yet to receive his
order.
Over years, I've heard many posts of complaints of
frank rip-offs by T. Ortman in this group. I can't
be specific, I didn't save all the posts. One
was about someone who ordered from him, then
Terry said he had to sue his supplier, and other
bs, but did not deliver the goods or return
the money. There have been a number of bad trader
stories from time to time here in csa8 about
T. Ortman.

Howdy Raphael

Have you ever tried it on a computer with the UltraSpeedPlus OS, by Bob Puff?
It doesn't jump to the OS RAM from Banked Memory does it? (I wanna multiplex the
OS RAM control line in such a way, that the status of the control line doesn't
change (on the OS side, while I use the signal comming from the PIA to control
memory.))

A yes, can't try it out as my 130XE (the only one with more then 64kB) is a bit
ill.

I think any "rules" for a trade should be between and established by
the parties involved in the trade. Set it up up front what the terms
of the deal are. Any party breaks the agreed upon terms gets on the
shit list. Plain and simple.

4121. 1050 Write Protect Switch

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-28 00:00:00 UTC
From: Bob Clark <bjclark@olemiss.edu>
Message-ID: <3545F695.221B4CD0@olemiss.edu>
Source record: 63434

My last working 1050 is having problems. It refuses format disks or even to write to disk. I believe that the problem is the write protect circuit: either the photodiode or the LED has quit. I have a couple of questions for the dedicated hardware people out there.

I do not have any technical data on this drive. What are the best sources of information on Atari hardware (schematics, timings, test point voltages, parts lists, etc.).

What I'd really like to do is just to install a toggle switch for the write protect. I've read that a couple of people have done this. First of all, since I don't trust my own visual identification, is the photodiode on the top side of the mechanism or the bottom? Do I need to put a current limiting resistor in the circuit or can I just short the circuit.

Thanks in advance

Atari 1020 Emulator? Does that really exist? I'd like to see that! You must have gotten that 1020 mixed up with something else. The Atari 1020 is a printer plotter!

Anyway, try Yogi's and Umich. You should be able to find the URLs in the Atari 8-bit faq.

My favourite 8-bit games?
Hmmm, let me think.
Pacman, it's a classic, just love it, on the XL/XE and the 2600.
Qix, just because I played it a lot in the arcade too.
Zaxxon, because of its play and 3-D effects.
Spiderman on the 2600, great game.
Defender, Missile Command, the Jag version are great too.
Protector, that was truly a great game.
Zeppelin, the multiplayer option.
Drol, for it graphics and play.
Pole Position (also because of fond memories in the arcade).
Ghee Whizz I could go on for ever :)
Bo.

> little longer...C'mon people.....Let's hear about your favorite 8-bit memories!

Yeah it looks like you started the ball rolling. I haven't seen such a
successful thread since the old C64 VS Atari 8bit arguments awhile back!
(heh, but I am glad that flame war is over!)

Hardhat Mack was done by EA for the 8bit as well! Nice game. The great
thing about the 8bit was with the release of the XE game system, many
great disk based classics were put on ROM like One on One basketball,
Flight Sim II, Archon, as well as other games never released (formally) on
disk like Into the Eagles Nest, and Gato..

all this sentimental nostalgia makes me want to fire up my trusty 800XL..
(even though I have Xlit which runs a lot of old 8bit stuff, it's just
not the same! (and fancy demos and stuff usually die on most emulators..)

Thanks for the credit! I was a hard core Atari 8bitter from about
1984-1994.. I was quite familiar with a lot of Atari software, but
anything recent (i.e. 1990 or newer for the 8bit, especially non-American
software, is "new" to me)

> In the coming days (weeks?), you will be seeing a fairly accurate alphabetical

I was told long ago that a Canadian (North American) Atari 800xl could not be upgraded to PAL and still work because of the electricity frequency in Canada? Was I mislead or is there any truth to this?

Does anyone use a PAL upgraded Atari 8bit in Canada/U.S. that could clear up any misunderstandings? I still have some PAL only games that I would love to check out. I even heard Double Dragon was released (PAL only), but I think that was just a rumour....

> somewhere :)

Heheh.. well the day I took my Atari 8bit BBS offline and sold it, was
the day I 'officially' lost my Atari 8bit certification.. now I am just
an old-timer with a 486. ;-)

Besides without a BlackBox and hard drive, an Atari 8bit is crippled..
ask anyone who uses a hard disk with the 8bit. It is Holy...
(That is another reason why I can't use my old 800Xl.. things are just
too slow....) But that is where Xlit comes into play! :)

The real funny thing about the Atari 410 recorder was it wasn't very reliable when it was released (later tape drives 1010, XC12 boasted about better reliability!) Also, tape software has a much shorter life-span than disks.. even if the tape recorder is "good as new", it may not be able to load in 'very old' tape data... (I remember sometimes loading the same tape game 2 or 3 times before it loaded properly on my 400!)

From: Christian Fowler <nospam-cfsoft@mailcity.com>
Message-ID: <01bd7300$13757160$c0d9ccc3@default>
Source record: 63451

My greatly loved Atari XF551 died a few years ago. Or, at least so I thought. Apprantly, there was a bad connection to the drive. I checked the SIO cable and it was fine, so that's not where the problem was. I checked the connection at the computer side, and even bought a new computer at some time, so that's not where the problem is either.
I read somewhere that the SIO ports on the XF551 can easily get damaged. I get the drive to work, but only if i plug the SIO cable into the drive, and put some heavy weight on the plug itself on the XF551 side.
Has this happened to anyone else?
If so, how did you solve the problem?
I can't afford to send my XF551 all the way to The States to get it repaired.

Thanks!

Christian

> If so, how did you solve the problem?

Christian,

Yes, this is a common occurence for XF551s. I have taken to not unplugging
551s once they have SIO cables in them.

The problem is that the solder connection on the XF551 mother board have
either cracked or just plain flaked off. You can try to do one of two things:

A) solder some jumper wires from the pins on the SIO jack to the connections
on the mother board (requires very thin jumper wire and a steady hand with the
solder pencil)

-OR-

B) Try to re-solder the pins to the board.

I suggest A) as it will completely prevent the problem from re-occurring.
Hope this helps

-Marlin

> 15. Star Raiders..

I worked at a Lazarus Department store in Evansville, IN in July '82 -
they had 1 800, one 400, a 410 and an 810 floppy drive on display (with
the cardboard still in the drive) and I think the 825 printer (roll
paper, kinda like tan newsprint? 80col?). After we sold boatloads that
Christmas they cleaned out half of the stereo dept. across the hall and
set it up w/desks for computers. I remember making up an audio cable for
an 800, running it under the carpet and over to the newest, fanciest
stereo system we had (a 100 watt Fisher, with one of those fancy, pricy
new CD players in it) and firing up Star Raiders. Guanteed to draw every
male within 1/2 mile upstairs to electronics. Man, I sold a lot of Atari
back then! <g>
I even remember selling 400's after they discontinued for $39.95 *with*
an Atari $50 rebate.
That started just after we had had 1200's for awhile and just started
getting 600xl's.

14. Defender...

I never could play this one worth a $$#@^*.

>
> 13. Choplifter! (Broderbund version)

This one would draw crowds, too - it was years before I even knew there
was an apple version...

> 12. Archon...

Still haven't tried that one - but I probably have it (I bopught out a
lot of friend's systems much later...)

> 11. Jumpman Junior...

I had a 600XL at home, and my mother used to play this and just cuss and
cuss at the computer... "I told you to go left, dumbass!" I have her set
up with the PC version now, but I haven't figured out how to adapt one
of those old Atari sticks to the PC...

> 7. Fort Apocalypse...

I didn't get this until much later, but a friend had it. He had a 400 *loaded* - real keyboard, OMNIMON, RAM, the works - and he had a VETREX.....

> 5. Caverns Of Mars...

I played the hell out of this at work - rough work if you can get it.

> 1. Shamus...

Yea, I played this one into the ground too.

I also have to add;

Preppie!

Zaxxon

and The Centipede sound effects would bring kids running for *miles* around...

P.S. Trying to learn Visicalc on an 800 makes me shudder at spreadsheets to this very day. Every year I do my department's budget @ work reminds me of that ^%$#&%$# Visicalc. - Geez.

The PC board on the XF551 has to have the award for lowest quality and
cost for any Atari product. The SIO connectors are not mechanically
secure enough to keep from breaking contact with the board. My solution
was to re-wire the PC traces with 34 ga. wire-wrap wire. Just solder new
connections from point to point on the board.

>again.

Congratulations! Mine worked, too - the first two times I did the repair. I
too refrained from moving my SIO cables, but the drive failed again anyway.
My solution the third time was to drill out the rivets holding the SIO connectos
to the board and replace them with screws before soldering the wires once
more. The rivets are VERY thin, and allow the connectors to flex far too much.
That was 6 years ago, and I haven't had the problem since.

The modems you mentioned are 300 baud (1030) and 300/1200 (SX212). Check with your internet provider to see if they run at those speeds -- some don't anymore. As for 'extra' internet software, you'll need VT-100 compatibility. The only VT-100 emulators I know of that will work with the 1030 are VT-Ten Squared (requires translator disk for XL/XE) and Omnimon. They might work with the SX212 with the right handler and/or through an 850 or similar serial interface to the SX212's RS232 connector. Also with an RS232 modem there's Ice-T and FlickerTerm 80. Both do VT-100 emulation. Check links to Atari web sites.

I ran into this problem regularly when I was doing 8-bit repairs for
atari-ville in San Antonio, TX. If I remember Atari even had a memo
on their service BBS about it. It's not a hard problem to cure. The
sio ports develop solder cracks over time which cause intermittent
problems. The best bet it to heat each pin and add some flux core
solder to it. This will strengthen the connection. I did this to both
my XF's as a preventive measure before they had a chance to act up.

Hi Alan..

All you need is to order the ANTIC PAL from best Electronics for the XL/E cost is 12.00 plus shiping. Its Lets you run all PAL software. I have 4 installed in 3 XL's and 1 XE. it dosnt realy turn your computer into a pal system, but it fools the computer in thinking its pal.. There are hundreds of New games and some great demos, Util etc that you could then enjoy..

Best Wishes..

Mathy,
Disk versions of SpartaDOS definitely use OS RAM. The SDX cart CAN use
OS RAM depending on your configuration. There are two settings that can
call OS RAM. In config.sys the first command us USE [OSRAM|BANKED|NONE]
the second is DEVICE SPARTA [OSRAM [nbufs [,nfiles]]]

I have a neat little BASIC XE program for building the autoexec.bat and
config.sys files. The config.sys section is a menu/option toggle system
and a couple of lines where you can specify in text things like your
path and prompt options. It allows you to set RAM disks and size(s) and
devices/device options. Pretty neat! If you want a copy, e-mail me.

Christian,
This is definitely a common problem with the XF551. The solder
connections on the XF 551's circuit board for the SIO connectoes is very
poor. The SIO connectors are not very well supported so, with plugging
and unplugging the SIO cable, the movement breaks the solder joints.
Simply reheating ALL of the pinf and maybe adding just a little new
solder fixes the problem "for a while". Eventually you'll have to do
this procedure again. Just be careful NOT to over heat the traces. They
lift off the circuit board very easily! Yuck!!!

Al,
There are many ways to move the files to a PC, but to use these file
with PC word processors, save the AtariWriter files in RTF (Rich Text
Format). This will pretty much preserve any formatting of the text and
make it fully readable to the PC word proceaaor.
Moving the files can be done by use of an SIO2PC cable and A.P.E. or a
null modem cable between the PC abd your 8-bit and a communications
program on each computer, or PC Xformer 3.50 or higher, an XF cable and
an Atari floppy drive connected to the PC. SIO2PC and A.P.E. is probably
the best methode, but all of these do work.

> Howdy Raphael
>
> Have you ever tried it on a computer with the UltraSpeedPlus OS, by Bob Puff?

Nope. Ramdrive by default comes set up to run under the Atari OS C,
but can also quite easily be made to work with the Atari OS B. I
don't know much about the UltraSpeedPlus OS, I assume its a ROM you
put inside your computer?

It may or may not work, depending on how different the UltraSpeedPlus
OS is from the B and C OS's. Fundamentaly it should work as long as the
location of the SIO vector hasn't changed, which I'd guess it hasn't
(if it had all current software using the SIO wouldn't work), and the
zero page addresses used by the SIO are still in the same place (I
can't remember what these are off hand, but they're around locations
45-60 more or less, they are listed in Mapping the Atari). If those
are the same then the basics should work.

The special Ramdrive features accessed by the Select (switch drives
and cold-start) and Option (write protect/unprotect and warm-start)
keys are another matter. To get those to work, the OS is hacked to
send keypresses to Ramdrive first. If that section of the OS has been
changed then you'll probably corrupt the OS. You can
either disable those keypresses (to avoid corrupting the OS), or
figure out where that code has moved to and tell Ramdrive where it is.
Both options are achieved with the ALT_OS command.

There are a couple of other hacks made by Ramdrive to the C OS, one of
those disables the OS warm-start integrity check (which forces the
computer to cold-start if the checksums don't match up) and the other
stops the computer from switching the OS ROM back in on warm/cold
start. Of course if you press the Reset key then the OS ROM will be
switched in anyway by the hardware, but Ramdrive lets you warm/cold
start without pressing the Reset key. These hacks might cause
problems with the US+ OS, but they can also be disabled if necessary
using the ALT_OS command.

I guess the best thing to do is to disable all the above Ramdrive
features and try it see if it works. If it does, then you can try
adding them one by one until either it stops working or they're all
back on again. If it doesn't work then it might still be possible to
get it working but I'd need some more info on the US+ OS.

The only other issue is finding just over 1K of free space to store
the Ramdrive code. By default it installs itself just before the
second character set (so you lose the 2nd character set). If US+ uses
that area for other purposes then you'd have to find some other area
of free RAM for Ramdrive (see below). I'm also assuming that the US+
OS can be copied to OS RAM and will run OK from there.

> It doesn't jump to the OS RAM from Banked Memory does it? (I wanna multiplex the
> OS RAM control line in such a way, that the status of the control line doesn't
> change (on the OS side, while I use the signal comming from the PIA to control
> memory.))
By default it runs in OS RAM, so the code that switches and accesses the banked
memory is in the OS RAM. If that doesn't suit you, then you can move
the Ramdrive code anywhere in memory with the LOAD_ADDR command. The
biggest problem there is finding enough free RAM that won't get
overwritten by other programs. Ramdrive itself only changes the OS
RAM control line when it boots (to switch the OS to RAM, and even that
can be disabled if you already have an OS in RAM when Ramdrive loads).
After booting, the OS RAM control line isn't changed. However
Ramdrive expects the OS RAM to be enabled whenever an SIO call is
made, if it isn't then Ramdrive will be disabled. The steps taken are
as follows:

On booting:
Ramdrive loads, copies the OS to RAM(*), hacks the RAM OS(*), installs
itself just below the 2nd character set(*), and inserts its address in
the SIO vector, remembering the address previously stored there. The
steps marked with a (*) can be disabled or modified.

When an SIO call is made:
The OS RAM needs to be enabled for Ramdrive to work, the SIO call gets
passed to Ramdrive first via the modified SIO vector, if the SIO call
is not for a ramdisk then it gets passed on to the original SIO
address, remembered during boot. Otherwise the correct banked memory
segment is switched in, data is read/written, main RAM is switched
back in, and Ramdrive then returns with either success or failure. By
default all this code runs in the OS RAM, but everything except the
original call from the SIO vector can be moved to any other section of
main RAM.

> A yes, can't try it out as my 130XE (the only one with more then 64kB) is a bit
> ill.
I hope your 130XE has a speed recovery =)

You can also run Ramdrive on a 64K machine, using the RAM under BASIC
as a small ramdisk. Just put the RAMD8K.CFG and RAMD8K.CPY files as
RAMDRIVE.CFG and RAMDRIVE.CPY on your Ramdrive boot disk. It would toggle a
different bit in PORTB, but everything else would work in the same
way. Of course, you need to boot with BASIC enabled for this to work.

Phew! That's a long posting. Hope it tells you everything you need
to know (and then some). If not then let me know =)

Another tip... I have Archon Ultra from SSI also. Thing is, I bought
it as part of SSI's "Critic's Choice: Strategy Collection" bundle. My
local Best Buy had Archon Ultra by itself and they had this Critic's
choice thing which included that game for LESS MONEY! Figure that
out. In case anyone is interested, the other games in the Critic's
Choice are:

Dark Legions
Ultimate Domain
Chessmaster 3000
Serf City (Life is Feudal)

I think the power supplies on the ealy 1040 ST's would be another candidate, Bob. Resistor leads T'ing into heat sinks and hand soldered joints! Definitely garage shop work. Fortunately, they were improved later.

The Atari 8-bit line seemed to gradually decline in quality from a very high initial standard. I guess that's what happens in a highly competitive, cost-conscious market.

I don't recall seeing this one pop up on anyone's list of favorite 8-bit games. I can't tell you how many hours I spent in this world, as well as the sequel (AR: The Dungeon). I remember seeing the guys who designed the games posted a synopsis of what the entire 8-part game would have been like, along with spoilers - made me dig out the 800XL and boot it back up... <sniff>...

Source record: 63476

Thanks again for the tips on fixing the XF551.
I re-soldered the SIO ports on the XF551 and it worked! From now on I'll refrain from removing the SIO cable at the XF551 side so it doesn't happen again.
While my XF551 was open, I found that the flat cable from the motherboard to the drive mechanism is identical to the one in my ST's SF314 and so is the power cable. In fact, the cables are identical to a PC's FDD flat cable.
Has anyone tried to remove the 5.25" mechanism, and replace it with a 3.5"? I've heard about these 3.5" upgrades for the XF551, but is this how simple it is done, or do you have to upgrade the ROM chip on the XF551 motherboard?

Thanks.
Christian.

> love to check out. I even heard Double Dragon was released (PAL only),
> but I think that was just a rumour....

Alan,

I use both a real PAL Atari 800 and a PAL-ANTIC 1200XL here in the US.

Replacing the ANTIC chip with a PAL version changes the screen refresh rate to 50Hz which allows most of the PAL-only European software to run. Your system will still report itself as a NTSC machine, unless you change the ROM (see the Nir Dary upgrade), but most software doesn't care.

The one problem you might run into is your monitor. Replacing the ANTIC will mean your North-American Atari is now generating an NTSC signal at 50Hz, instead of the usual 60Hz. Some people will tell you that modern TVs and monitors don't care but that isn't actually true. My brand-new Sony Trinitron 15" colour TV/monitor goes bezerk with the upgraded 1200XL, but my 15-year old 10" Texas Instruments color monitor (designed for the TI-99/4A) is fine.

You can also use real European equipment here in North America, provided that you have a PAL-compatible TV/monitor. The frequency of the power system is irrelevant, as I use my 800 with a 110V/60Hz 1050 power supply.

Hope this helps

Graham.

I really don't like that kind of games, lots of time to load makes real
disk-drive busters, i think i will give them a try when i get my SIO2PC...
The arcades in the other side are great to play:
Montezuma's Revenge: How is the end of this game???
Fort Apocalypse: WOW���
Eastern Front 1941: Can't be beaten..
Archon: Great battles...
Karateka
International Karate Champinship...
Boulder dash: I've never going further level 5.....
Wlockzijik ¿Is the name right???? form Avalon, one of the best plataformers...
Centipide
Defender.....
And hundreds of others, not forgetting all those great games that we, ok i,
used to type from old Antic mags.....

Javier.

Ok, here it is...

1) Encounter - riveting 3D game, great sound and colors
2) Ballblazer - one of the best 2 player games of all time
3) Necromancer - I've played this hours at a time
4) Return of Heracles - I love it! (don't know why exactly)
5) Mig Alley Ace - another great 2-player
6) Defender - better than the arcade version I think, I could never master it
7) Karateka - the graphics got me on this one
8) Enchanter/Suspended - Infocom = cool

Oh, and DRELBS! What a strange game! I'm sure there are more but
those are the ones that come to mind.

Hi there. I had the same problem and at the time was adventurous... more like fed-up!

I just removed the two wires from the photo-detector and connected them together. Voila! It now formats or writes to anything! No need for the protect notch to be covered. If you are worried about erasing something, just add a switch in place of the junction you just made. In fact, that sounds like a good idea!

Chris

Sounds like the switch that I have installed on my 810 and 1050. A
bunch of us in our users group had switches that would bypass the
write protect. For the 810, the switch had a third position that was
wired so that any sector writes would produce bad sectors.

It was nice being able to use both sides of disks without
hole-punching the write-protect tabs.

Dropzone rocked !

Best played with a Quickshot 2 suckered to the table top, index finger poised on fire. Spare hand free to apply smart bomb or shield when things got too outta hand.

Anyone know what Mr McLean does know? He would have been a great guy for Atari to get to write games for their Falcon or Jag systems. World Karate Champs, that was cool too. Some excellent karate moves, and 3 player action! And a 3-d pool game too I think? (well, 2 outta 3 ain't bad !) In fact in and OLD C&VG magazine he was rumuoured to have written a version of Elite for the /|\ 8-bit (but sadly it was just that)

Anyhow, what do you think the Dropzone guy was doing after a wave was completed? Waving, saluting, cleaning his visor or picking his nose???!!! :-)

Cheers,

John E Cash.

Last thing I knew of was a 3d poole/snooker game in the early 90's that
got rave reviews and did very well for itself. He is still a well
respected coder/developer in the UK and at the time of the last game got
shed-loads of magazine space with interviews etc. He tends to be a
perfectionist and only does what he wants and releases it when he thinks
it's perfect, judging by what I've read.

> OLD C&VG magazine he was rumuoured to have written a version of Elite fo
> r the /|\ 8-bit (but sadly it was just that)
The vast majority of Elite are now PD after the original author released
them to all to the net via his web site (don't know the address).

Very unlikely I'd have thought. If you were a firm would you not release a
product because it was better than the previous version? Even if some
serious egos were involved I doubt any firm would take such a crass view
of their economic position.

I've always assumed the rumour was a product of atari-fever/wishful
thinking. I'm sure you could do a damned good version on the 8bit,
probably half way between the beeb and ST/PC versions. You'd need some
pretty cunning use of gr.8/PM Gfx to get the resolution and add in some
colours though ;-)

Phoenix,
You should be able to run any BASIC program and even some BASIC XL
programs (BXL runtime package necessary for this) on any of the
emulators. The PCXf 98 is the only one so far of the PC Xformer series
that seems to be able to use the BXL runtime.
As for moving files from the PC to the 8-bit, definitely get A.P.E. and
an SIO2PC cable! The null modem system works too, but slowly. The XF
cable and PCXf is read only on the PC.
Downloading files for the 8-bit on the PC is no big deal and can be
easily moved to a real 8-bit system.
Hope this helps. Good Luck!

Bob,
At one point I designed a one chip circuit and DPDT center off switch
arangement that allowed normal Atari mode, FULL protect, and full write
access. The normal DPDT switch arangement only allows full write and
normal mode. There were times when the full protect mode came in handy.
If anyone is interested, I'll dig up the schematic for it. It took more
wiring, byt worked pretty well. This system also included a red LED for
full write mode and a green LED for full protect mode. I don't remember

if I had one for normal (yellow for Atari normal mode).
That XF 551 drive also had Bob Puff's XF Enhancement controller (the
one that allows formatting of flippy disks) in it too. What a drive!

+AD4-easily moved to a real 8-bit system.
+AD4- Hope this helps. Good Luck+ACE-

O, yeah, I do know about that, but here's the problem:

1. Text file typed up on an IBM PC
2. Emulator on Same PC
3. Import file somehow into emulator and run.

I figure a plain text file can be read somehow off the same HD by the EmU.
I also figured the EMU has to 'initialize a disk for use+ACI- before this is
doable so it can be saved to a disk image.

Please help explain how this can be done, if it can.

4183. Elite on the Atari 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-30 00:00:00 UTC
From: jmouchmino@aol.com
Message-ID: <1998043014192900.KAA02197@ladder01.news.aol.com>
Source record: 63346

I read that the Atari version of Elite had been coded half way through...
Unfortunately, the programmers left and the game remained unfinished; it seems
the company couldn't find coders good enough to finish the project...
Don't know if it's true...
I'm sure a C64 or Apple II port should be pretty easy to do, though...

4184. Worst games!!!

Newsgroup: comp.sys.atari.8bit
Date: 1998-04-30 00:00:00 UTC
From: jmouchmino@aol.com
Message-ID: <1998043014193000.KAA00918@ladder03.news.aol.com>

For a change, let's try out a list of truly awful games; avoid the following by all means!

My selection:

Airstrike (English)
Apple Panic (Broderbund)
B-Ware games: any!
Cannibals (?)
Castle Top (?)
Caverunner (English)
Crypts Of Plumbous (Cosmi)
Dambusters (?)
Fishing Fun (?)
Forbidden Forest (Cosmi)
Gorgon (and, for that matter, anything else from General Masters)
Green Beret (Imagine)
Haunted Hill (Swifty)
Hawkmoon (LK Avalon)
House Of Usher (Kingsoft/Midas)
Jaffar (Mirage)
Kamikaze (Star Gazer Ent.)
Karmic Caverns (Len Dorfman/PMI)
Kayos (Computer Magic)
Kissin' Kousins (English)
Knockout! (Anco)
Krazy Kopter (English)
Leisure & Business games: Cybernome and Shatablast
Mad Jax (Red Rat)
Monkey Magic (Alternative)
Moon Patrol (Avalon Hill)
Piekielko (LK Avalon)
Red Baron (Sebree Computing)
Richard Petty's Talladega (Cosmi)
Rosen's Brigade (Gentry)
Speed Zone (Mastertronic)
Springer (Tigervision)
Stargate (Atari)
Universal Hero (Mastertronic)
Xenon Raid (English)
etc.

Thanks to all that replied. I now no that its safe to simply short the photodiode circuit, but I still have one question. Is the photodiode on the top or the bottom of the mechanism? I really don't trust my visual identification. I'm just guessing that the LED is NIR and that I couldn't see anything from it anyway, but I certainly don't see any light.

Robert, that certainly seems as if it would be a useful modification. Under full write mode, won't it allow formatting flippy disks? As my system stands I already have the full protect mode. :-)

Thanks again.

I've heard many rumours about Elite for the Atari, including that the game was finished but never released because Acornsoft thought it was *too* good and would detract from the BBC version.

I personally don't believe that one, and I don't know enough about 6502 assembler to guess how complex an Apple port would be.

Perhaps some our very talented East European friends could take some time out of developing ever more impressive demos to port this classic game to the Atari?

For those interested, Ian Bell's Elite home page is:

http://people.netcom.co.uk/i.bell/elite/Default.html

and you can download the original Elite for most systems from there.

Graham.

Damn, Bertrand! I have to say I don't remember having the displeasure of playing most of these crap games, but I do agree that Springer was complete garbage! (Nice label though, illustrated by Ross, who did the Miner 2049er illustration.) Some other games that I think really suck are:

Halftime Battlin' Bands (CBS)...Probably the dumbest idea ever for a videogame. Ugh.

Alien Garden (Epyx)...Umm...what are you supposed to be doing in this game?

Frogger II: Threedeep (Parker Bros.)...I know a lot of you will disagree with me on this, but I love the original so much that I was expecting so much from this one. I really hate it. Can't play it for more than a minute.

Chicken (Synapse)...One of the lamest Kaboom rip-offs ever. (I believe it was after Kaboom, right?) It's hard to believe this came from the same people that brought us Shamus, Ft. Apocalypse, Blue Max and Necromancer. Great title, huh? Chicken!

Astrochase (First Star/Parker Bros.)...Only because after the mind-blowing (back then) intro, the actual game was such a letdown!

Congo Bongo (Sega)...My friend convinced me to buy this instead of Jumpman Junior. I may have actually cried after realizing I wouldn't have enough money for another game for weeks. I eventually talked the salesman into believing that my mom got me the wrong game, and he let me exchange it. This really was a lame-ass conversion.

Bug Hunt (Atari)...Does anybody actually ever play this game? I mean I like the other light gun games...Crossbow, Crime Buster, Barnyard Blaster...but what were they thinking when they made this the pack-in for the XE? "Look at our great new system with green monochromatic graphics!" What a pile.

Well, that's all I have time for right now. I'm sure I'll think of a few others. Later.

-Scott Wozniak

I seem to remember still another type of switch that had 3 positions:
1) protected
2) unprotected
3) determined by disk punch hole (the original method)

Ok here's how....

Use Atari800Win for the emulator. It has a capability to map a
directory on a PC drive as an Hx: volume on the emulated Atari. Now,
this "Hx:" drive is very limited for obvious reasons. What you can do
though, is in the emulated Atari, copy a file from an H drive to a
disk image drive. Obviously, you will need a valid disk imagem drive
for the destination and some kind of Atari file system to make use of
it.

I used SpartaDOS 3.3 Pro or something like that under Atari800Win 1.9.
Worked for me but had some sporadic results using the H drive. I had
to fiddle a bit like restart Atari800Win and stuff. Don't remember
what all, but I was learning about how it worked at the time.

Well, an Apple port has been done (you can get it from the official web page).
I forget if there's a Commodore port. 6502 assembler isn't really the problem
(because the BBC has a 6502, as do the Apple, Atari, Commodore, and Nintendo --
yes, there is a NES version on the web page). The obstacle would be the
variations in the machines' graphics-hardware design philosophy and speed.

Source record: 63355

There are a couple or so ways to do this easily. You'll need to get a couple of utilities, though.

First of all, if the file is a simple text file in ASCII, you'll need to convert it to ATASCII. Remember that you need to convert all CR LF's to Atari LF characters. The utility TT.EXE, available in several archives, will do this, as well as the reverse. It's really handy for getting old word processor files from the Atari to MSDOS, too. Once you do this, the rest is pretty simple.

The emulator XL-IT 0.20 allows you to mount a file as a disk drive. If you wanted you could then copy the file into a disk image file. Other emulators allow this as well, I'm just more familiar with XL-IT. You can create new disk image files by using MSDOS to copy a disk image to a new file name, mount the file in your emulator, and then erasing all of the files on the disk.

Another easy way I have found is to use ATRIMG11.EXE, which is available at several archives. This program runs on a MSDOS computer (Win95 works for me.) and moves files on the MSDOS file system into and out of .ATR disk image files. It can even create new disk images. It works with MYDOS and Atari DOS disks, but doesn't seem to read SpartaDOS disk directories.

Another program of this sort is IMAGEMAN.EXE. Take care with this one though. I tried it out under Win95 and it mangled the disk images beyond use. It works in MSDOS mode though.

Hope this helps.

I thought someone here might be interested in this. Follow this link for more
info or to bid. The high bid right now is only $5.50, it ends in a few days.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=12111506

Here's the description, sorry for the poor formatting, but if you go to Ebay
it's formatted correctly:

Spectravideo SV328 computer with a 904 tape drive and 40 different original
cassette programs. The SV328
was an early 80's quasi-MSX computer with 80K of RAM. A pretty
interesting little piece of machinery. This
unit works fine, as does the tape drive. It includes the power supply,
original switchbox, and cable for the tape
drive. I tested about 10 of the tapes and they all worked. The 40 titles
are (titles with an asterisk include the
original insert): 3-D Tic Tac Toe*, Acutype*, Address Book*, Armoured
Assault*, Biorhythm*, Compatability,
Financial Calculator*, Findit*, Graph Master, Introduction to BASIC*,
Juno Lander, Killer Car, Kung Fu
Master*, Masterbrain, Maze Cup Champion*, Memory Trainer, Mini Golf*,
Morse Code Tutor, Music
Composer, Ninja, Nomis, Number Game, Old Mac Farmer, Puzzlemaster,
Spectra Break*, Spectra
Checkbook, Spectra Diary*, Spectra File Cabinet*, Spectra Font Editor*,
Spectra Home Economist*, Spectra
Sprite Editor*, Spectra Type*, Spectrabrain, Spectramind, Spectron, Star
Words, SV Jungle, Swing Man, U.S.
Geography 1, and U.S. Presidents*. Buyer prepays plus shipping. Thanks!

Archon

Everyone's played this one. Chess-like strategy/battle game

PitFall II

Very cool, especially the "second world" which I could never solve. Anyone got a walk through for it?

Gauntlet

(not like arcade -- this was a shareware game). You fly a little ship around and battle aliens. You have an energy shield and fly from screen to screen. The last 50 screens are inside caves. Good graphics, very challenging. Anyone know where to get a copy these days?

Defender

Easier to play than arcade because I found the arcade controls difficult to master -- the 8 bit version is better with the joystick. Otherwise, its very true to the arcade version. Its pretty easy. I got to where I could play continually at about a million points per hour for however long I wanted, but I don't think I ever scored more than 11 million.

Mr. Robot and His Robot Factory

A very cool game.

Captain Beeble

Guy flies around with a jetpack, bouncing off walls. Goal is to pick up an energy crystal while avoiding moving aliens, then return it to a box within a certain amount of time. Very challanging upper levels!

AngelWorms

What a crazy game! The goal is basically to navigate a growing worm around the screen while your oponent does the same. The front of your worm moves faster than the back end, so the worm grows. If you crash into yourself, your opponent, or the wall, you loose the round. The longer the timer runs, the more the "round" is worth. You play until one player gets a certain number of points. My dad, who was in his 50s at the time, LOVED that game and we would play it for hours when I was about 13-14 years old.

Energy Czar

A cassette atari education game. Basically you control the nations energy policy and try to become popular. I don't think it was possible to win if your "bias" was solar!

Lunar Outpost

You had to fly a ship around an underground lunar outpost picking up energy rods and avoiding obstacles. Very tricky.

Atom Blaster

You have a tiny space ship and successively work your way through the periodic table of elements shooting electrons off each atom. When you shoot all the electrons, the nucleus explodes and you move on to the next element. However, the more missing electrons, the more you are pulled into the nucleus (where your ship explodes). I don't think I ever got past Flourine. If anyone else ever got much higher, I salute you! My friend Robbie and I were on a quest to get to Uranium, but given the amount of pull the nucleus had and the amount of thrust the ship had, I think it would have been impossible.

Ah! that reminds me of another strange game. Bandit or Bandits.
The sounds produced by that game made me think of someone... well...
farthing or something similar.
But the game was great.

You could play forever? Wow! Amazing! Never lasted that long.
Those nasty aliens always mutated and started to follow me until I blew up.
At a certain point in time I could play Pac-Man forever on a 2600 though.

Yeah, that one was a favourite too, well, still is :)
I dunno, nowadays people finish those pc games using cheat codes,
I don't know if this is/was possible on the 8-bit too...
Anyone know of cheat codes for the XL/XE?

+AD4-else having this problem??
+AD4-Help+ACE-
+AD4-

I had the same problems, this is how I solved it:
Delete the .cfg file. Place all the OS roms in the default dir, and when
you run the Atari800.exe, hit enter to all the prompts to set them to
default (you can change the directories for the games and stuff manually
with a text editor). It seems that if you specify the exact dir for the
different ROMS (even if it's where they actually are) it doesn't recognize
them.

I'll have to mention that to the author.

There are hundreds of great P/M graphics tutorials in Antic, Compute, Analog, etc, etc. I have some of the issues, even BASIC ATARI BASIC which covers PM in enough detail so the beginner can catch on. If you want 'free' info I would suggest checking out those FAQ URLs that Michael Current posts every month or even the Antic homepage. (I beleive you can view articles from most of the old Antic magazines.. sorry, don't have the URL on me) If you are interesting in buying a book from me, send private mail..

I have all 4 big Atari XE light gun games.. CrossBow and CrimeBuster are
fantastic in terms of graphics and game play. I found barnyard blaster to
be more disappointing than Bug Hunt. Bug Hunt actually sports some nice
animation that I haven't seen in many other games. All those bugs
crawling around and spinning.. I agree most of the light gun games are
quite mindless (apart from CrossBow and CrimeBuster that at least have a
logical finish) Atari packed Bug Hunt with the XE system becuase they
knew nobody would actually PAY money for it! :)

Just to add my two bits to this thread.....

My favourite 8 bit games were, in no particular order....

1. Eastern Front 1941 (This game made me buy an Atari)
2. Star Raiders
3. Donkey Kong (Incredible version)
4. Fort Apocolypse (My jaw dropped when I saw this game)
5. Jawbreaker (gotta love that toothbrush!)
6. Miner 2049'er
7. Shamus
8. Caverns of Mars
9. Mule
10. Defender (Closest to the arcade game)

Willy

Hey all,

This is a most sucessfull thread. I suppose that is because most (if not all) 8 bitters are hopeless nostalgic romantics.
On another subject, I remember legendary fights and batlles (not all on the screen) over Archon. I got so good beating the computer, I would just take one Icon and move it down the board exterminating the enemy. Playing against human beings however was another matter. We used to have games that would last for hours!!
I remember one time my friend came over who was also darn good at archon. We played until each of us had one icon alone on the screen. My icon was the wizard. GUESS WHAT? I hadn't used my imprison spell. Used it and won!!!
I got called everything except a son of my mother he he!

Talking about all nighters (games that is) I think Bruce Lee was a particulary addicting one. One time I started playing, mustta been 10 pm next time I look at the clock it was 6 am. That was the first time I finished the game. Also discovered the famous cheat that gives you unlimited lives.
People have said that they think this was a bug on the program. I beg to differ. In the original package, they talked about the " secret of immortal life". The yin-yan thingies they had on level 15 only gave you 8 lives and never reappeared after you finished the game.
In case someone doesn't know what the cheat is, in level three going down the stair if manuevered correctly bruce will get stuck on the lower left side rungs. His head starts doing an exorcist imitation (no joke). If the samurai and ninja are directly under him, Bruce starts falling on them (or kicking them) repetedly and you rack up a tremendous amount of points in no time. With that lives start going up. I went 99+ lives. Then play to your heart's content.

>disk-drive busters, i think i will give them a try when i get my SIO2PC...

I never had either of the AR games, but I remember lusting after them madly.
I suppose they were a bit out of my price range back then. Still, there
were plenty of multi-disk games that were fabulous. I can't imagine not
liking a game because of a high load time. The load time just increased the
anticipation. :-)

Let's see... there was Autoduel, on four sides, which I loved. I totally
lost myself in the idea of being a futuristic courier/vigilante, even though
I usually got killed before getting too far. I'm waiting for my emulator
of choice to run it correctly, and I shall be very happy.

Hmm... Phantasie II by SSI. My first real RPG. Also on four disk sides.
I have no idea how many hours I spent playing this one. Hours and hours
every day for weeks. When one of the disks failed, I sent the set in to SSI
and wrote them a rather eloquent request for replacements... in 1991. I
believe I had to look up their address in a business directory, because they'd
moved from the address in the manual. They sent me the replacement disks
for free which was a really classy move. I know they weren't supporting the
Atari by then; they could have just blown me off. I'd love to play this
one again on an emulator, but my Phantasie II disks are far away.

And while they aren't among my favorites, Mask of the Sun and The Serpent's
Star are both good games on multiple disks. Anyone else have any favorite
"huge" games?

Just dug out a few classic old game cartridges, including the original owners/instruction manuals, for the Atari 8-bit computers:

- QIX
- DEFENDER
- CENTIPEDE

If anyone's interested, you can have all three cartridges along with the original documentation for $5 plus shipping (allow $3 for priority mail shipping if in the U.S.). Please respond in Email.

Also.....

Found a "THE MONKEY WRENCH II" cartridge and users guide. This is an excellent machine language cartridge utility that adds 18 new direct mode BASIC commands. (In the original Atari 800, "THE MONKEY WRENCH II" is used in the right cartridge slot with the BASIC cartridge in the left slot).

If interested, you can have "THE MONKEY WRENCH II" for $5 plus shipping (allow $3 for priority mail shipping if in the U.S.). Please respond in Email.

Sheldon (Computer STudio - Asheville, NC)

>
> Thanks again.
>

Bob,
That depends on the drive. The XF551 does NOT do flippies in OEM
configuration. It is a real DSDD 360K floppy drive. To make one of these
drives format a floppy as 2 single sided (flippy) disks, you need the XF
Enhancer from CSS (Bob Puff). This is a seperate modification from the
protect/unprotect/normal switch mod.
Hmmm... (More on my protection switch design) If I remember correctly I
had to use chip for the LEDs not for the actual control of the
protection mode. The Center OFF of the switch had to be manipulated to
turn ON the green LED.

Pitfall 2 is great. I used to be able to finish it in 20 minutes. I have a wico atari stick wired to a gamepad so I can play it on the emulators, and it takes about an hour to finish now. I HATE trying to get the rope. Thats the hardest part.

I tried Airstrike again; I still find it completely unplayable (at least the original version).
Apple Panic is really terrible: slow and nearly impossible to control, IMO of course...
Jet Set Willy was fun on other platforms, but it's really awful on the Atari...
Congo Bongo has to be the most horrible arcade conversion around (tied with Stargate...).

4222. PM Graphics Tutorial? Anyone?

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-01 00:00:00 UTC
From: ericcron@wwa.com
Message-ID: <3549efc7.9896685@news.wwa.com>
Source record: 63373

Anybody want to write a tutorial on PM Graphics?

I've been searching around, and I really can't find a straight forward

tutorial. Sure, some of them are okay, but they usually just end
up confusing me. You know, "Heres a way to use pm graphics in non-
standard ways" Geez, I just want the basics. Maybe we can call it
"Player Missle Graphics for Idiots"

I did type in the program from Compute!'s first book of atari. It was
written by Chris Crawford. I was following him a bit, but I got lost.
I figured I would start small: change the shape of the player.
So I got out some paper, scribbled an eight by eight grid, got some
binary numbers and changed them to decimal (a big feat for me).

So what happens when I go to change Chris's data statement? He's only
using 5 numbers! ARGH!!!! What happened to the other three?
Shouldn't
there be eight? Darnnit! Pong 98 (my masterpiece :)) is never gonna
happen!

Oh yeah, another tidbit: This sample program(the one in compute!)
ran
at least twice as fast in Turbo Basic than in standard Atari Basic.
What a great improvement! It's really too bad the older models can't
wing it... I wonder how fast it will go if I compile it?

Question: Is vertical movement always slower than horizontal?

Anyway, I would sure love to have a simple tutorial. Stick a player on
the screen, move in all directions with a joystick, make it shoot a
missle, and thats it! I've been reading
this group for two years now, and I know there are plenty of ace
programmers out there that could probably whip one up in no time.
And I know I wouldn't be the only one to benefit from it. Sure beats
arguing about Terry Ortman :)

By the way, I am working on a HTML version of the 850 Interface
Operators Manual. I will announce here when it is finished (probably
about a week)

>Anybody want to write a tutorial on PM Graphics?

I'm not up to it, though there might be a decent one in an old book called "Your Atari Computer: A guide to Atari 400/800 computers" (by Lon Poole, Martin McNiff, and Steven Cook, published by Osborne McGraw-Hill). It was written in 1982 so you'll probably have to go to the library to find it.

I say "might" because although I got the title from my public library's online catalog, I'm not sure if it's the book I was actually reading. :)

>I did type in the program from Compute!'s first book of atari. It was

>I figured I would start small: change the shape of the player.
>So I got out some paper, scribbled an eight by eight grid, got some
>binary numbers and changed them to decimal (a big feat for me).

You could probably write a little program to do that for you. It could INPUT some string and compute the binary number.

```
10 DIM A$(10)
20 INPUT A$
30 TOTAL = 0 The decimal number to be found
40 VALUE = 1 The significance of the current bit
(1, 2, 4, 8, 16, 32, 64, 128)
50 PLACE = 9 The character number of the bit
(9, 8, 7, 6, 5, 4, 3, 2)
60 BIT = 0
65 IF A$(PLACE, PLACE) <> " " THEN BIT = 1 If you typed a non-space, the bit
is set -- otherwise it's clear
70 TOTAL = TOTAL + (BIT * VALUE) Add the current bit
75 VALUE = VALUE * 2 Get ready for the next bit
80 PLACE = PLACE - 1
85 IF PLACE > 1 THEN GOTO 60 If we just added the last bit,
PLACE has just become 1 which is
not the position of any bit --
we're finished. If PLACE is not 1
then there are bits left.
90 PRINT TOTAL
95 GOTO 20
```

A$ is 10 characters long instead of 8 because the first and last characters must be something other than a space, or else BASIC may cut the string short.

This kind of input works nicely.

```
[ . . ... ]
[ . . . ]
[ ... . ]
[ . . . ]
[ . . . ]
[ . . ... ]
```

>So what happens when I go to change Chris's data statement? He's only
>using 5 numbers! ARGH!!!! What happened to the other three?
>Shouldn't
>there be eight? Darnnit! Pong 98 (my masterpiece :)) is never gonna
>happen!

Yes, but maybe he POKEd some of them twice, or assumed that some would be zero (and just never made allowances to read them).

>Question: Is vertical movement always slower than horizontal?

Yes. Horizontal movement involves changing one memory location (which will cause the Atari to change the horizontal location at the very next TV frame). Vertical movement involves changing many memory locations. You might be able to get it done by the next TV frame but if there are too many changes to make, it won't happen.

Think of it this way. (At least this is how I understand it.) There really is no law that says players have to be 8 bits high. Actually, they can be higher. (256 bits?) There IS a limit on width, though. In other words, a player is a narrow vertical strip of graphics. The Atari will move the strip left and right for you, but the strip takes up the whole screen height so it can't be moved up and down very quickly.

Your particular program leaves the strip mostly empty. Vertical movement involves changing where the non-empty parts are -- you have to make the non-empty parts empty (so you don't have extra copies of your player) and make new non-empty parts. This involves a series of POKEs.

I love that game. I just made it to Phosphorus last night. It really
helps to catch the electrons after you shoot them; they're a thousand
points, and you get a free life at ten thousand. You also get extra
points for shooting the protons as the nucleus blows up.

An important strategy is to start by shooting the electrons in the
outter shells.

BTW, I thought the name was "Atom Smasher," not "Atom Blaster," even
if the latter name is more appropriate.

Source record: 63379

Age of Adventure, Return of Hercules, Ali Baba and the Forty Thieves, I have this old Atari disk but I can't play it since I don't have an atari anymore. Are these games for C64 or Atari emulators out there? I have look but I haven't found a working version. Anyone know where these might be?

Thanks in advance.

"Ali Baba and the Forty Thieves" (1981) and "The Return of Heracles" (1983) were released by Quality Software. Written by Stuart Smith. Electronic Arts re-released both as "Age Of Adventure" in 1986.

4229. EQIVALENT KEYS ON ATARI FOR "F" ON IBM

Source record: 63380

I am using an Atari 130XE computer with ICE T Ver. 2.72 emulator on the Internet through my library online service. The card catalog menu on my library system says "PRESS F1" etc. Are there any ASCII code numbers for the "F" keys that I could emulate? Or better yet does anyone know of the Atari Key combinations that would work?

Is there any solution to this problem short of connecting an IBM type keyboard to my 130 XE? Any help is appreciated.

Atarily Yours
Ron Fetzer el032627@nassaulibrary.org

You can find these at the hackerz archive at ftp.hackerz.com/atari.
Although I've never any luck running Ali Baba, ROH works great.

ROH is one of my all time favorite games. I love the variety of
characters and the atmosphere. Whenever I play any other game and I die, I
still say "I just gave an obolus to Charon!" or "I paid the debt that
cancels all others." Great fun!

4232. EUROPEAN SOFTWARE REVIEWS - PART 1

Message-ID: <1998050121352000.RAA05627@ladder01.news.aol.com>
Source record: 63383

EUROPEAN SOFTWARE REVIEWS - PART 1

G stands for graphics
A stands for animation
S stands for sound
V stands for overall value

Reviews only reflect my opinion...

3-D Pac
Raindorf Soft - Germany
G - 65% - clear and adequate
A - 45% - average
S - 80% - partly digitized!
V - 55%
The name says it all!
Very frustrating game, unfortunately...

180!
Mastertronic - UK
G - 74% - good hi-res stuff
A - 70% - nothing fabulous, but nicely done
S - 75% - with speech!
V - 67%
Nice darts game!
A competent program.

A-Zone
B-Ware - UK
G - 50% - very average
A - 35% - substandard stuff
S - 28% - obnoxious...
V - 32%
Substandard platform game!
Move over...

Acrobat
Muenzenloher Software - Germany
G - 30% - basic stuff
A - 50% - nothing extraordinary
S - 33% - you gotta be kidding...
V - 55%
A very old (1982 or something) and simple title.
Actually, it's just a Circus clone, so is worth a try or two; at least, no bad surprises...

Action Biker
Mastertronic - UK
G - 50% - not fantastic; sloppy presentation
A - 60% - control is OK
S - 55% - not great, but there's worse
V - 62%
After all, this was a budget game (sold on tape at a very cheap price), so...
Not unforgettable but quite playable...

Adax
LK Avalon - Poland
G - 74% - colorful
A - 77% - nothing to complain about
S - 72% - debut of the Polish era...
V - 74%
Difficult but very pleasant arcade adventure with some cool touches.
A very professional game.

AD 2044 - Sexmisja
LK Avalon - Poland
G - 74% - very clear
A - N/A
S - N/A
V - ??%
A point and click adventure which seems to have numerous locations and looks
really great to play, but COMPLETELY in Polish; maybe with a dictionary...

Advanced Pinball Simulator
Code Masters - UK
G - 59% - looks like a Spectrum game!
A - 50% - not really super
S - N/A
V - 63%
This game could've been nice, but it's just too difficult to play.
Technically speaking, it's far from fabulous.

Adventures Of Robin Hood
English Software - UK
G - 60% - colorful, but sprites are ridiculous
A - 56% - nothing difficult to do...
S - 52% - what can I say here?
V - 40%
Very repetitious gameplay.
No imagination.

Air Strike
English Software - UK
G - 35% - uninspired...
A - 40% - jerky...
S - 35% - nothing new...
V - 22%
Joystick responsiveness is the whole problem...
Sorry, but I feel this one is just too frustrating.

Airwolf (later released as Blue Thunder)
Elite - UK
G - 50% - colorful, but you still get a sloppy presentation screen...
A - 40% - sluggish
S - 30% - normal...
V - 35%
Could've been fun...
This one starts so-so and quickly becomes irritating.

Amaurote
Mastertronic - UK
G - 86% - really great hi-res graphics
A - 84% - nice, too...
S - 86% - very good music and super sound effects
V - 74%
Highly original game, once you know what to do...
Strange stuff, so may not appeal to everyone.

Amnesia
Robert Stuart - UK
G - 92% - stunning detail
A - 93% - even more stunning!
S - 65% - does its work...
V - 82%
A game similar to Matchboxes...
Simple, but expertly designed PD game; REAL Atari programming...

Arax
? - Germany
G - 74% - nicely drawn
A - 72% - again, good stuff
S - 60% - OK
V - 69%
Vertical shoot'em up similar to Xevious or Flak.
Tough, but a nice little program.

END OF PART 1

A 3-D trading game with great action. It's a big game for it's time and it was coded in the UK. BBC was the first and best version, but later the ST, Amiga and well almost everyone got it, except the Atari 8-bit :-(

That would be cool to get up and running on the Atari. Anyone wanna hack a C64 version and convert it ?

Take Atarian care

You liked Jet Set Willy on the Atari 8-bit ? Totally bad controls :-(But the music was by far the best of any platform. Thanks to Rob Hubbard, who coded some excellent music on the Atari

Yes sir;

go to;
http://closertohome.dyn.ml.org

Find the ftp directory called "more_Atari8bit"
(spelling?????) anyway, goto the game dir, then files dir
then "T" dir......"TRON.ARC" is there, I just looked

It was one one of those games for a day when you
were not up for a mental challenge :)

In addition to some of the other suggestions, you might want
to try and get a copy of De-Re Atari. In the back was a jiffy
little program that used string manipulations to move a player
on the screen. The idea was to make screen ram a string, then
use basic's ability to quickly copy strings to move the object.
Always thought it was a clever idea......

My vote for worst Atari 8-bit game would be 'Aliants'.

It was harder than $%# to land the ship even when using a superior quality joystick. I don't think you even had a chance to land it with a standard joystick.

After landing, the game was nothing.

I too had heard rumours, and had spoken (about 4 years ago now) to someone who had done some cartridge development for Atari UK who said that Atari did have Elite sitting around somewhere...

However, I recently emailed Ian Bell about the existance of an 8-bit Atari version and he replied that no version was ever written and quashed the rumour that Acornsoft halted the release of an Atari version due to it surpasing their BBC version.
I also took the opportunity to ask for the 64 source code (emense cheek) so that I could do a port but without no joy :-(

Still, I have disassembled the 64 version with the aim to write an Atari version and maybe to use the code as a base for doing some DirectX/3D programming. Its early days (I've gone back to this after looking at it 3 years ago) and I'm only about 5% done, but having now located the line-drawing and text message generating routines more specific areas of code will be easier to deduce.

Other games I'd like to do (or seen done)... The Sentinel and Paradroid

Along similiar lines... How far did Epyx get with 8-bit Atari versions of Winter Olympics and Summer Games II? I remember them advertised as 'Coming Soon' in part of the scolling message for games like 'Beer Belly Bert's Brew Biz' released by US Gold in the UK.

Mark.

>I love that game. I just made it to Phosphorus last night.

Now to folow up to my own post: I just played this last night and made
it up to Sulfur. I noticed that it's not totally accurate as you get
past the first few elements; there aren't enough electrons in the
second shell, so when you get to Neon, there is a third shell with two
electrons--not what I would expect from a noble gas. Anyway, when you
get to sulfur, the third shell is full, making you wonder where they
would put the next electron. Well, it seems that they wondered the
same thing, because when you blow up the sulfur atom, you go back to
sulfur. The only difference is that each subsequent sulfur atom has a
stronger pull, as if you were starting with something larger, but had
already blown away some electrons.

I made it through four or five sulfur atoms. I didn't really like
being stuck there with all that sulfur. :)

A bit late perhaps, but I thought I'd have a go.

In no particular order:

Boulder Dash 1, 2 and BDCC.

Dropzone. Nice 'n' boring when loading from tape.8-(

Dan Strikes Back. Loaded nice 'n' quick form tape:-)

Mr. Do. Didn't load nice 'n' quick from tape:-(

Bounty Bob Strikes Back. I'm surprised this hasn't been mentioned yet. I guess you're all using emulators.

Jet Boot Jack. Let it rock!!

Rescue on Fractalus. I nearly crapped myself when that green git jumped up on the screen!

Bruce Lee. Fat green bloke and skinny black bloke with a stick.

Blue Max. Bombed on the sodding runway again.

Star Wars. Not on the 800XL, in the arcades. Well, it was Atari I think.

Have fun, take care.
Sean.

4251. How about your hi-scores...

Loads of folk have been posting what their favourite games are.
What I'd like to know is how far did you got in them. What's your hiscore? What level did you get to?

Do tell, then we can argue about weather it's true or not;-)

I've forgotten most of mine, but I do remember a couple:

Mr.Do! 609 000 odd. Can't remember the exact score 't was a long time ago.

Star Wars (Arcade) 70 000 599.

Are these pathetic?

Go on, get playing then get posting.
Sean.

4253. FT: Classic computer stuff for Atari 2600

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-02 00:00:00 UTC
From: bilstein@mail.utexas.edu
Message-ID: <6ifuld$o8d$1@geraldo.cc.utexas.edu>
Source record: 63266
Cross-posted to: rec.games.video.classic,rec.games.video.marketplace,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.amiga.marketplace,comp.sys.apple2.marketplace,comp.sys.tandy

I have a ton of classic computer stuff that I would like to trade for Atari 2600 games and hardware. I'm not interested in selling anything right now though. While I don't have a list of everything I have (way too much), I will be happy to search through it if you have a want list or request. I know this is pretty vague, but I may have that special piece you've been looking for as I have some unusual things, and I'm more into the Atari 2600.

I have hundreds of items: games, utilities, cpu's, printers, disk drives, tape drives, controllers, peripherals, etc, for the following systems:

Apple 2, Atari 8 bit, Atari ST, C64, C128, C Plus 4, Vic 20, TI 994A, Color Computer, Amiga, and more.

If you have any rare Atari 2600 stuff for trade, drop me a line.

Thanks!

Picked up a Commodore 1701 monitor for $10. It came with the monitor-jack-to-chroma-luma-audio cable (thank goodness) and I plugged it into my 800: wowee-zowee great picture! Sound too, only problem is the flip down buttons cover is long gone and it has "$10.00 As Is" written in laundry marker on the top.

There's a Good Will store down the street from my place, and the electric/electronic stuff moves weekly. The cashiers are religious and always tell me "have a blessed day."

A month ago I picked up a BEAUTIFUL condition 640k XT with 20 meg HD and CGA monitor for $75.00.

They had an NES with remote control joysticks down there too ($15.00), maybe I'll pick that up to sell on eBay.

Alex Bilstein wrote:
>
> This is in Texas, so perhaps other states differ, but:
>
> Just to clarify, a money order is *not* as good as cash at a bank.

It's not just Texas. I've lived in IL, MI, TX, and OK - all banks I've ever walked into will only cash ANYTHING if either you have an account with them, or the item in question (check, draft, MO) was from their bank. I expect different banks have slightly different policies, but that's how it's been everywhere I've gone.

But one thing I have never understood is why it takes SOOO LONG for a check to clear. The way money is moved around electronically these days, it should be damn near instantaneous! I mean, when a check bounces, you've got written notification of the fees in your mailbox in under a week!

When I moved to TX from MI, I opened my new account in TX by writing a check drawn on my old account. They told me it would take "up to" 10 working days to clear. Two weeks with no access to my money! Well, it happened to be near the end of the month when this happened, so just a few days after writing the check I got a statement from my old bank, and on that statement was the check I had just written. Obviously it had cleared! So I got out that brand-spanking-new checkbook of mine and paid a few bills. And of course all those checks bounced, and the bank assessed a $20 fee for each one. Now it is clear that my new bank already had my money in their coffers (and earning money for them), since my old bank had already made good on the check. And yet they refused to allow me access to my money. Of course I went down there and bitched until the waived the fees.

Sorry for the rant, but this whole "check clearing" thing has always bugged me since it is obviously a way for banks to keep the cash in their hands and out of yours so that they can squeeze a few days of interest out of it.

Was there an Atari version? I remember playing it on an Apple II at
school. That and Robotwar. Both of which would be cool to convert to
the Atari at this late date.

4264. Anyone sell CD's with games?

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-03 00:00:00 UTC
From: Nog <avigold@ix.netcom.com>
Message-ID: <354C2273.491B@ix.netcom.com>
Source record: 63277

Hi,

Since I am new to the emulated 8bit arena, I am wondering if anyone here know where I might buy CD's with games that have long since gone public domain (or whatever happens when the company that wrote the game is no longer around).

I just remember the glory days of MULE, bruce lee, alternate reality, ...

Someone help! :)

4265. Re: Elite on the Atari 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-03 00:00:00 UTC

Don't worry about it too much. The Atari has got the best version of
"Mercenary" which kicks Elite in terms of speed and gameplay.
On the C64 at least.

JMouchmino (jmouchmino@aol.com) wrote:
: I read that the Atari version of Elite had been coded half way through...
: Unfortunately, the programmers left and the game remained unfinished; it seems
: the company couldn't find coders good enough to finish the project...
: Don't know if it's true...
: I'm sure a C64 or Apple II port should be pretty easy to do, though...

wrote in comp.sys.atari.8bit about
"Re Favourite 8-Bit Games" (ao):

> A bit late perhaps, but I thought I'd have a go.
> Bounty Bob Strikes Back. I'm surprised this hasn't been mentioned
> yet.

This is my favorite, too, and IMDO one of the best games ever.

> I guess you're all using emulators.

But it runs great on Atari800 .9.4 and XL-It 0.20!

I think it's just that a lot of people here in c.s.a.8 are not aware
of the fact that it runs on the emulators, and maybe if they knew the
cheat codes for getting to all the levels etc., it would pop up on a
lot more "Fav Games" lists. (If anybody wants the cheats, I could
post them again).

I have the file version (must fill up all of the XL's memory!) of
Bounty Bob on a 180K Double Density .ATR image with a SpeedMenu
(which loads very fast on my [real] Happy 1050), and XL-It boots it
just fine. But Atari800 doesn't seem to support 180K DD .ATR's (yet?)

Does anybody have an easy solution (utility?) to somehow convert
the files from my DD Speedmenu disk images to, say, 130K disks
that Atari800 can read? That way I can use them on both emulators.

Yes, I could manually copy them with XL-It and SuperDOS from D1: to
H1:, but I have over 500 of these game files, so if there is a
simpler solution, I would really like to hear it! Bo Schreurs'
XLFILES utility also doesn't do DD images :-(

Or maybe Atari800 could implement DD .ATR disk support in an upcoming
version?

And just a last question: I read somewhere that Marcus (author of
XL-It), finishes his school sometime this year. Any hopes that
he might pick up work on XL-It again? Not that it isn't a great
emulator already, but he might want to join the (friendly) race
with Atari800 again? ;-)

Hmm. The first time I hear of it taking so long. All International Money Orders I've sent out, took from 1 week to 3 weeks or so, and when they got it, they cashed it and sent me the goods. No one ever told me they had to wait for a check clearance. I mean, the money is prepaid and it's not waiting to be drawn from my account. The post office get the money when I send the IMO. Anyways, I did apologize to him, but still feel he could have answered my emails from 4, 9 and 10 of March. He claimed he only checked the mail once a week, but the first answer after this was on the 21 of April, which makes up for more than one week.

Well, now I too know that it can take a while to clear and will take it into consideration in later deals! Thanks to everybody who has responeded and take care

The file version I have runs great! Now who has a site I can upload
it to, including docs and cheats? Or does it already exist somewhere?

> > .. the cheat codes for getting to all the levels etc., ..
> I must have missed that. If nobody has an objection, I for one
> would like you to post it again, thanks.

OK, there are some other simple cheats, but the "Big one" is this:
Go to the Options screen (with "Option" :-), and using your joystick,
set "special code" to 61800 (This takes a while, but it's worth it).
This only works immediately after starting the game!

Now hold down the letter "f" key and press OPTION again. So that's
F and OPTION together. It seems as if nothing has happened, but in
the game, you can use the following keys:

- Q : Advance one level
- A : Decrease one level
- Z : Same level again
- F : Float mode on: This one's great: If things get too hard or
impossible to play, just press F and float your way around the
screen.

Now this is all from memory, I sure hope I got the right keys, but
I'm sure you'll tell me if I made a mistake :-)

So come on everybody, start your XL-It! 's and start floatin' !!

May Auction

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, May 20 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

>Bounty Bob Strikes Back. I'm surprised this hasn't been mentioned yet. I guess you're all using emulators.

I liked this, but I never was a fan of the gameplay.
But the options/features were amazing! (smoker)

>Rescue on Fractalus. I nearly crapped myself when that green git jumped up on the screen!

what a cool game, I still wonder why nobody took that fractal-idea for a newer game...

>Blue Max. Bombed on the sodding runway again.

This is (still?) censored in germany ;-)

>Star Wars. Not on the 800XL, in the arcades. Well, it was Atari I think.

I liked that (on 800XL).
Later I saw it in the arcades. Wow! Now I know what a "crap-game" this is on 800XL!

>Or maybe Atari800 could implement DD .ATR disk support in an upcoming
>version?

I patched my copy of Atari800 to support DD .ATR disks. The code is
all there, but it doesn't compute the offsets correctly. If you look
in sio.c, it should be relatively obvious if you have any programming
experience. (Just remember that with DD ATR images, the first 3
sectors are 128 bytes, and the rest are 256 bytes with no padding.) I
sent in patches, but it would seem that they were not incorporated.
(I haven't upgraded past 0.8.6, mainly because it's just as easy to
use my real Atari.)

4278. Atari Emulators - informal review and question

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-03 00:00:00 UTC
From: AKatz712@juno.com
Message-ID: <6iicoc$ljg@bgtnsc03.worldnet.att.net>
Source record: 63291

My name is Andy Katz. I live in the USA and I owned an Atari 400 computer since 1981. When I got my PC in 1994, I took apart my Atari so now it no longer works. Recently I got nostalgic for some of the games. My favorite was Miner2049er, so I searched the internet for it. As it turns out I found that the most direct way to play it again is to use an Emulator. I was suprised by the number of emulators there were for the 8-bit Atari machines.

The purpose of this email is to write my informal review and some questions. I tried out 6 emulators listed below in the order of usefulness:

1. Atari 800 Emulator for Unix, Amiga, MS-DOS and Falcon, Version 0.9.5a by David Firth.
- Great sound and picture
- Hard disk access a great feature
minor annoyances:
- picking a disk image (i.e. Dos) and a basic cartridge each time (or placing it on the command line). You have a CFG file and it should have these parameters.
- when picking a disk image the .. does not allow one to traverse PC hard disk directories. So it means all my disk images must be in the same directory.
- keyboard typing speed is sluggish, so it sometimes misses characters. (It is in your bugs.txt)
bug or question:
- How do I use the Atari's insert and delete to edit? The insert and delete on the PC keyboard always does a whole 'line'. If it was not for this problem I would have not done the review in the first place and stuck with this emulator.
General remark: I am amazed that you emulate on all these hosts and I only found these few problems.

2. XL-it! Atari 8bit Emulator Version 0.20 (c) 1996/97 by Markus Gietzen
- Nice user interface
- Hard disk access a great feature
- Sound and Picture seem to work, but there seem to be some minor anamolies when compared to David Firth's emulator, for example, see the opening in Miner2049er.
minor annoyances:
- Does not support dynamic insertion and removal of cartridge once emulator is running.
bug or questions:
- How do I use the Atari's insert to edit? The cntl-insert on the PC keyboard should work like the Atari. Note that unlike Firth, control-delete does work.

3. PC Xformer Classic 3.60 - The Atari 130XE Emulator For MS-DOS Compatible PCs

Distributed by: Emulators Inc. (c)1996 -1997 by Darek Mihocka.
- Very fast smooth accurate typing
- Nice feature to switch various Ataris with and without cartridge
Minor annoyances:
- The interface to enter disk images could be easier to use.
- The command line options should be replaced by a CFG file.
- No direct hard disk support (you allow only one hard disk file to act like a disk)
Major bug or deficiency:
- Only tonal sounds are supported. Sounds also interfere with timing. I am sorry to say that without accurate sounds, the Atari experience is just not there for me.

4. Pokey.. The Atari 800/800XL/5200 emulator Version 0.62 9/10/96
- My question on this one is, is there a more recent version available? You do not support hard disks (note that this limitation can be overcome by using other emulators which through Atari DOS can be used to fill up ATR disks with games). Your colors are off (yellow on blue may be easy on the eyes but it is not true Atari). Also, the keyboard joystick behaves oddly.
Major deficiencies:
- No sound emulation.
- Much too slow.

5. Atari800Win An Atari 800/800XL/130XL/5200 emulator for Win32 Version 1.9 Based upon David Firth. Win32 version by Richard Lawrence
- This looks really promising. Unfortunately I am using Windows NT on a P120 and it is SO SLOW and my sound drivers do not support direct sound. Bottom line is - Go to DOS - it is an inconvience, but it is trustworthy.

6. Rainbow 95 - The Atari 8-Bit Emulator for Windows
- This demo was so limited that I could not seriously get into it.

Finally:

All emulators supported a joystick on the keyboard. Some versions also suported a PC joystick, but since I do not own one, I did not look into that capability.

My next project is to get my Atari work over to my PC. I spent many many hours in the early 1980's typing listings from magazines and developing my own work. It rests on Atari floppy disks (the 5 inch kind) and I do not own an PC disk drive of that type and as far as I know they have not been sold with PCs for years. I do have a Rana 1000 disk drive. I have my doubts if that monster would still work after sitting idle for 15 years. I would appreciate any advice in this area.
Thanks.

- Andy Katz -

P.S. I do not intend to be overly critical. I only wish to give my observations and hope to be of help. I appreciate all this work and I am thankful for it.

That bugged me, too. I sent in a patch for 0.8.6 that made the menu
include subdirectories. I guess it didn't make it into the
distribution. :(

If you want to see about patching it into the current version, you can
find my patches at:
http://www.cs.dartmouth.edu/~crow/atari/patch/

4282. FS: Atari 8 Bit Hardware/Software

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-03 00:00:00 UTC
From: Richard Parker <richard.parker@nashville.com>
Message-ID: <354CD31B.DFDE8ED3@nashville.com>
Source record: 63295

I've just placed a load of 8 bit Hardware and Software on Auction Web.
Check it out by following this link:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?MfcISAPICommand=ViewListedItems&userid=rparker2@aol.com&include=0&since=-1&sort=2

4283. ---> SUPPORT MEGA 3 <---

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-03 00:00:00 UTC
From: Chris Swinson - MEGA Disczine <mega01@globalnet.co.uk>
Message-ID: <6iimukkgu1@heliodor.xara.net>
Source record: 63296

For those of you who have not seen the best disczine around send a E-mail to me and request issue 1 or 2.

If you have seen MEGA why have you not supported this new zine. There are lots of you out there who must of liked something in it. But you don't tell us what you liked and what you didn't.

It only takes a moment to return the questionnaire, or to offer some ideas of your own. We need your support NOW. The more support we get the faster MEGA will be produced.

The MEGA member list is getting slowly longer but we need more feedback, We need to know that people are reading it and liking it, There would be little point in producing a zine if there is now one reading it.

So come on, Lets have some feedback, I want to make it YOUR zine, Let us know what your would like to see happen and the MEGA team will support your idea.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time.

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

If you have seen UFOST by Lee Round then please support his UFO zine with you UFO related material. Lee is now in 2 minds weather or not to do issue 3 because of all of you how seam to be scared or writing a letter to him.

--
From Chris Swinson (MEGA DISCZINE)

PM's are 8 bits wide, but any number of bytes tall - from 1 to, well, up
to the height of the screen.
>
> Question: Is vertical movement always slower than horizontal?

Yes - PM's are positioned horizontally by graphics hardware - a simple
poke to an 8bit memory loc moves it quickly. Vertical movement you have
to copy all your sprite image data around in memory (so if it's 8 bytes
tall, you have to move 8 bytes of data to move vert). That's why
vertical
is best done in an assembly routine.

>
(the above based on ancient, error prone memory! corrections and proofs
appreciated if appropriate)

Somebody had the ol' Bitfire "Hackerbook" for sale on Ebay, but the
price got bid way up beyond what I'd pay - so was looking for a nice
refman with CIO, Display lists, etc. Check out the other chapters in
the online refman for all the gory details (display lists chapter15
is missing some at the beginning)

Andy:

I personally bet your old Rana drive still works.

If you have a modem you can upload all your old files to a BBS, and download them for use with an emulator on your PC. Also there are a couple varieties of serial/parallel cable arrangements called SIO 2 PC and APE.

What I did with my old disk software is send it off to another 8bitter I met on this group, Yogi. He graciously transferred and emailed the disk images, and I gave him most of the actual old software. Maybe he'll help you out, but you really need to have some good stuff to give him.

The best emulator is XL-it in my view, and if Markus Gietzen is still taking donations, someone please supply a current address, because I am overdue with my payment for this great free program.

There was an Atari version called "Prisoner 2." I played it for a while
back in the mid-'80s. It was a graphic adventure game, and very
perplexing. The more I played it, the less sense it made. It seemed to be
based on the TV series (I'd seen every episode before I got the game), but
there was no mention of the connection in the packaging or documentation.
Very strange. I've always intended to go back and try to finish it...

Be seeing you...;-)

>Protector II) is a good example. BTW, has anyone played either Nautilus or
>Shadow World? I've got these on my list at
><http://www.dadgum.com/giantlist.html>, but I've never seen either game.

Yeah I used to have Nautilus, one of two games that I had on cassette
(the other was the original Sierra version of Frogger.) It was kind of
fun, as I remember you drive a submarine around while avoiding (among
other things) a ship dropping depth charges from above. They were
tunnels to go through and you had to manage your air supply somewhat...
unfortunately I can't remember the point of what you were trying to
accomplish exactly.

I thought the graphics were quite good and it had a decent two
player mode. I also remember waiting for ever for it to load until I
found an article in like Analog 4 that facilitated converting tapes to
bootable disks -- like 6 years later, couldn't believe I had spent so
long waiting for the tape to load for so long. oh well.

Can anyone help me find these 3 bits of software (atr's if poss).

Quest for the Maltese Chicken....Published by Futreware??
Orb of Zaramear (or something close to that)..also Futureware..

And a PinBall Construction hack called Knob n Knockers..

The first two were published by the Sidewinder people and hold fond
memories since I helped to get them published. They are more likely
going to mean more to Brits as they were published in the UK only but
I was suprised to find my "new level" hack of Sidewinder (Raid over
Libya) on the Hackerz site so Im hoping.

BTW if anyone wants the Level editor for Sidewinder I still have it...

Quest was a left to right Frogger type game written by John Kavanagh
now of Domark software and Orb (if that the name) was a Temple of
Apshai type game written by Michael King a UK policeman...

Any help would make an old bloke very happy...

I've got an interesting article from Gardner Computing about copy
protection on the Atari. If I can get some spare time, I'll try to
type it into a text file so everyone else can read it. It's pretty
long and in-depth, and it covers just about all of the copy protection
schemes at that time (and how to defeat most of them).

I'd also like to know where I should send such a file, once it's
completed -- UMich? I should also be able to uuencode it right into a
post, but I'll wait to see how big of a file that will be first.

Stay tuned...

Steven

MFC42.DLL is the Microsoft Foundation Classes version 4.2 library that you'll need to get A800Win to work. The programmer has probably switched compiler versions for the "b" beta that now requires this library. You can get the .DLL from www.microsoft.com; just do a search for it from the main page and you should get to it. Once you find it, you'll need to download it to \WINDOWS\SYSTEM.

BTW: This isn't a fault in Atari800Win, per se. The fact that the programmer chose to use the MFC instead of writing his own class library means that all users of the program will also need this file, which is not usually provided by the programmer. Search your own system first to make sure you don't have it anywhere, since the MFC is quite a large file, if I remember right.

Good luck,
Steven

4306. Z-Machine Interpreter For Infocom Style Games

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-04 00:00:00 UTC
From: stevenposey@usa.net
Message-ID: <354dca13.259661203@news.ioa.com>
Source record: 63319

Has anyone else discovered the joys of z-machine interpreters? These little creations let us play ALL of the Infocom interactive fiction games on our pc or mac, provided we have bought a copy that gives us access to the .dat file that contains all of the z-machine code (like Activision's Sci-Fi Collection CD-ROM). The interpreter will read the .dat file and let you play the game, regardless of what platform you're running on. On my Win95 machine, I use an interpreter called WinFrotz, that works great. It's also possible to use a language and compiler called Inform to create your own adventures!

Here's the problem: I can't find an interpreter for my Atari :-(I've got all the Infocom games, and I can play them directly from the original disks, but what I'm really looking to do is to write some NEW games, and I need an 8-bit interpreter to play them on the Atari.

Does anyone know if one exists?

For those interested in z-machine, check out the interactive fiction archive at:
ftp.gmd.de/if-archive
Here you'll find interpreters for most all other platforms, as well as a large collection of freeware z-code that you can play right away.

P.S. Some may ask, "What is z-machine?" It's the Zork-Machine, of course. It's a virtual machine that's platform independant, and can be used to write full text-applications (graphic apps in version 6), with reusable class libraries. Hmm, sounds a little like Java, doesn't it?

Steven Posey (stevenposey@usa.net) wrote:
: Here's the problem: I can't find an interpreter for my Atari :-(
: I've got all the Infocom games, and I can play them directly from the
: original disks, but what I'm really looking to do is to write some NEW
: games, and I need an 8-bit interpreter to play them on the Atari.
:
: Does anyone know if one exists?

Well, yes, they come on Infocom disks.

I'm not being facetious here: there is a utility which allows you to assemble new C64 Infocom/Z-Machine games using the original Infocom interpreter--someone ripped the code out and figured out how to stick a Z-data file into a disk image along with the interpreter to make it work.

Now, the major hurdle you'd be facing is that I'm pretty sure there was never an interpreter for the Atari better than V3 games, which limits your scope when creating a game. (I don't think a single full Inform game has been written in V3, only demos and shells and the like)

You'd also have to figure out how to encode the interpreter on the disk image.

Another route you might try is to hunt down the 6502 source for the Oric Infocom interpreter a European Oric hacker coded up. You'd obviously have to do a lot of playing around to get it working on the Atari, but it would be a starting point.

4309. Alternate reality on HD?

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-04 00:00:00 UTC
From: he110@cleveland.Freenet.Edu
Message-ID: <6ila0k$553$1@alexander.INS.CWRU.Edu>
Source record: 63322

I just had an interesting idea: I wonder if it would be possible
to use an Atari 8-bit with a Black Box/HD and copy the three
Alternate Reality disks to disk sized partitions on your HD,
and therefore be able to play the game with absolutely minimal
disk transfer time? What sort of copy protection exists on the
disks? YES, I *_HAVE_* the originals, and I am allowed a backup,
correct? This is what I'd use the backup for! ;-)

Have a look at the readme for it as it mentions in there about a F key
or a crtl key plus another to move the screen up and down...

Honest :) (thinks its an F key)

I use the wonderous Win version from Rich as its has a higher screen
res and a few tweaks as well. Petr says that the resolution is on the
"to do" list....

Otherwise happy alien hunting....

Another problem is that cassettes were not very reusable. Once you
recorded over a previous recording 2 or 3 times, the bleed from the
old recordings (still barely audible beneath the new recording) often
caused I/O errors.

Cassette drives. Wow, I *really* don't miss those.

Since some weeks Iï¿½m surfing through the Internet and downloaded some software, mostly Demos.
But till today Iï¿½d never managed to run those Demos on my 800xl.
The Demos with the *.ATR-Extender work on my 486/dx2 80 with xlit .20. But how can I use the ATR-Files on my 8-bit?
The files with the Extende *.DCM were converted without any error by Diskcommunicator 3.2, but booting the created disks results in reading the first sectors and then... nothing!
What is it worth for posting somuch PD-soft in the Internet, when the good old 800xl never gets the chance to run it???
please help me!!!

4317. Alternate Reality Help

From: comdungeon@aol.com
Message-ID: <1998050423253100.TAA28186@ladder03.news.aol.com>
Source record: 63330

I've been looking for a copy of Alternate Reality: City & Dungeon for my XL for some time now but haven't found one. Getting the urge to play, I decided to try XL-It and a copy of the Dungeon in .ATR format.

The game seems to run well, until I get to a point (like a battle) and it will say "Insert Disk 3 into any Drive". At this point I'm not sure what to do.

I set up XL-It so that Disk one is in Drive A, Character Disk in Drive B, Disk 2-Side 1 in Drive C etc etc..start playing the game and then get to a point where the game will still ask me to insert a certain game disk in any drive. I've tried putting the various game disks in different drives but it doesn't seem to work.

Any help anyone could give as to how to get the game set up on XL-It would be appreciated.

4319. Atari DOS for Commodore

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-04 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6im7l9$me3$1@newsd-199.bryant.webtv.net>
Source record: 63332

I remember in the deep dark past of 1983, my girlriend at the time, despite my exhortations, decided to get a Commodore 64. And of course, I was always helping her deal with the bloody thing.

And of course, the Commodore DOS was the biggest pain-in-der-ass this side of the Digital Rainbow. So I had this great idea, to make a BASIC program emulate the Atari DOS menu to make things alot easier, like formatting disks, etc. Worked pretty good, too.

4320. IBM USB port = Atari serial bus

Newsgroup: comp.sys.atari.8bit
Date: 1998-05-04 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6im8ndmek1@newsd-199.bryant.webtv.net>
Source record: 63333

I may be oversimplifying things, but I read in the paper about the next great thing for MS-DOS machines, the Universal Serial Bus (USB). According to the article, you'd be able to plug drives, printers, modems, and the like into each other.

Now tell me if I am wrong, but didn't Atari have that back in 1978? Of course, the idiot writer doesn't know that and attributes it to Apple Machintosh, which didn't come out until 1984...

4321. Just bought Ape Face

I owned both computers as a child.

I own both computers now (recently re-acquired a C128 and an 800XL) and I STILL think that the Atari is vastly superior.

I've seen a few postings here and there by those unfortunate to never have owned both machines.

The Atari is simple, crisp and user friendly. The Commodore is a pain. It was then and it is now.

One of the greatest things that I have to note, is that the Atari newsgroups are full of intelligent people still clinging on to their memories, while the C-64 newsgroups and web pages for that matter are fairly barren.

I just wanted to say it is obvious which machine the real computer users were purchasing back then.

You may have a problem getting them to run off a PBI hard disk inaterface. AR
City uses its own SIO routines, not the ones in the OS. You might see if
the cracked version was converted to use the normal SIO handler.

> 1. Jumpman..........

I'll second that nomination, and add only three:

--> Kennedy Approach
Your air traffic control at one of several US airports, fairly simple untill you start juggling a lot of planes or a thunderstorm heads for Denver. Neat-o thing is the voice synth, no special box required, so when you give a plane it's orders, it says:
<static>
UUUnited threeee zerooo nine --- turn left to ninety degrees --- climb to five thousand feet
<static>
RRRRRoger
<static>

--> Tapper
Unique concept. Your a very busy bartender with a lot of thirsty customers, and you have to fill a beermug and fling it down the bar before they come and choke you; then you have to be there to catch the empty's they fling back. Sometimes they leave a tip, which you can get (while filling, flinging and catching) to hire entertainment or fix up the joint.

--> Alley Cat
Another unique concept. Your a cat in the alley, and have to jump up on some boxes and garbage cans, then onto a fence. If you don't a dog comes along and starts a fight. Once on the fence you jump up onto some clothslines moving back and forth, people throw shoes out the window at you, and you jocky around to jump into an open window. Once in, you go thru various things (can't remember 'em all) like a fish bowl, etc. Then go thru another screen of platforms, and when you get to the top of that you meet another cat, fall in love (meow!), then it's back to the alley. I used to leave this in demo just to watch the cat run back and forth, wag it's tail and meow, and you don't have to clean out a catbox.

May Auction - Update 2

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, May 20 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

Brant,
Yes. You need a cable with a male RAC phono plug on one end and a male
F connector on the other end. Select the channel you wish to use with
the switch on the back of the conputer (2 or 3) then tune your TV to
that channel.

Steven,
The Umich archive is a perfect place for this. You can u/l it (FTP)
directly to /atari/8bit/new (i believe or better yet e-mail it with a
one or two line description to Bill Kendrick at
kendrick@zippy.sonoma.edu. Bill is the archive care taker and will post
it in the proper place.
You might want to see if you can find a way to scan the document in
then do the minro clean up. This will be MUCH faster and easier for you.

Source record: 63145

Hi Tom,

Well obviously being in an Atari newsgroup you are going to get a bias opinion and Commodore users will obviously give their merits to their C64's and 128's, but all in all the Atari 8-bits were better machines, the Commodore's were superb low cost cut down clones of the Atari's (I've just recently had the pleasure of meeting with the 3 men who designed the Vic-20 and C64 and they explained that those systems were exactly that, low cost cut back clones of the Atari 8-bits), but they're cost combined with a large media push put the C64's ontop, its amazing what people will buy :)

Hi Mark,

USB, the concept is sort of similar, of course far more superior and faster then the Atari SIO bus, but the same basic concept. Yes, it does very closely resemble Apples ADB (Apple Desktop Bus) which allows keyboards, printers and such all to be connected together.

Curt

>know of the Atari Key combinations that would work?

Doesn't ICE T provide DEC VT100 terminal emulation? If so, I would
think the ICE T documentation would provide the information on which
Atari8 keypresses are mapped to VT100 keys. Check it out my man.

>Is there any solution to this problem short of connecting an IBM type
>keyboard to my 130 XE? Any help is appreciated.

Well, that is no solution at all because you can't hook up such a
keyboard to your Atari8. Well actually you can if you have Transkey
or something, but even then the special keys on the PC keybaord are
mapped to Atari keys, so it would seem to your Atari as an Atari
keyboard anyway. Right back where you started at; full circle.

>Help!

Probably a modified or "patched" version of the original Atari ROMs.
Does it give you a warning about the checksum being incorrect? I have
some special versions some of the OS ROMs that have very fast math
routines etc. and I get a checksum warning. I ignore it and use it
anyway. Anyway, if that isn't it, make sure you specify the rom files
in the appropriate dialog box in the options.

Opps, I'm thinking of Atari800Win. You are using the DOS version?

What "Cracked" version? Is that the same as the "FREEWARE" version?
If it's truly freeware, wouldn't it be "re-released freeware" instead
of "cracked." Authors don't usually have to "crack" their own
software, they simply change it.

All I have is the original ones, so a freeware or cracked version is
of interest to me.

I know who NassauNet User is. He and I have real names, but the Nassau Library System (NassauNet) doesn't automatically put your real name in anything you post here. That's why I'm sending this from my regular ISP.

NassauNet User and I are both fine when we want to use NassauNet for PINE (email and Usenet) or LYNX (WWW and Gopher.) The problem is isolated to another menu choice, "Telnet to your library's card catalog." Since your user name on the system contains a code for your local branch, you are automatically connected to that branch when you telnet in this fashion. Although NassauNet is county-wide, the software that individual branches use for card catalogs is not uniform. I have no trouble with my branch, because it's not really dependent on Fn keys, and posts alternate key combinations for the few that it does use. NassauNet User's branch is highly dependent on Fn keys.

Now about Ice-T. The docs don't provide any substitutions for PC-style Fn keys. But FlickerTerm does. NassauNet User either has FlickerTerm or can get it from me, but we both prefer to use Ice-T.

Well, here's where I have a problem. I used FlickerTerm to access NassauNet and had no problems, except for the fact that I couldn't replicate NassauNet User's conditions. Soooo, I set FlickerTerm to R2: (you can do that) and set up a null-modem to my PC. I figured I could press FlickerTerm's substitutes for the Fn keys and see what shows up on the PC's screen. But pressing _ANY_ key on the Atari started a continuous send of that character, similar to what happens when you have "screaming characters" as a result of an incorrect RS-232 handler. And yet, FlickerTerm with the same handler does OK over a modem.

I couldn't solve NassauNet User's problem, and I'm pressing for more heads to get together over this one so that we can help him out.

Please, guys?

Thanks

Alan Sharkis

ADB can connect just about anything...I've seen it used to connect the
machine to networks, printers, scanners, etc. The drawback is that its
very slow...so most businesses will expand their machines with extra cards
for this purpose. However a small business/home will go cheap and put up
with the slow speed of ADB :-)

4347. FS: Atari 1027 + AtariWriter + APX Spell checker

hi !!!

I would just like to know how many of you out there run a atari based
bbs???

if you run an atari based bbs and would like to get your bbs on the net,
throue a type of telnet
type system, then this message is just for you.

i'm new to atari, I have a friend who is helping me set up a atari
board.....
now, I was thinking of how to set up the atari in a telnet style system
so people on the net
can telnet to my bbs.

I did come up with a solution, using a PC with ppp and a sort of a
plug-in idea.....
where if you lets say have a 4 node bbs, you must connect your pc to the
net
then run this software, and when people try to telnet over to your
site.... each
user goes to a different rs232 port and null modem connected to one of
your bbs nodes....

is anyone here also into pc software to write this pc based program??
that would be cool
this way you could put your atari bbs on the world wide web.....

if, no-one here is a pc programmer, maybe we all could pitch in and pay
a programmer to
creat this program....

let me know your feelings about this
send me e-mail

thanks

Jose

thanks I'll check that out.. ;) I tried the windows version, but it's SO much slower I think I'm sticking with the dos version..

maybe there's a speed limiter in the windows version?? I know I've seen the dos version run some things much faster then the old machines could.. ;)

if there a function that allows you user definable speed increase?? (some things would be MUCH better at a faster pace.. fratcalus for instance would be just nice if it was just about 20% faster then the original speed..

On the other hand, I'd be kinda interested to see shamus running faster.. I can't IMAGINE that game at the hardest difficulty faster!! LOL!!

Hello Atarians!

I'm still looking for an european Atari XE with at least 128 KB RAM.
Send your offers directly to me, as I don't check the newsgroups very
often.

Thanks in advance,

Martin (a.k.a. Pimpf)
martin@jaleo.idecnet.com

I don't think at this time you will find anything in what you are looking for as the Copyrights on what you mentioned have not expired and it is not likely that they are going to give them up freely.

Several individuals on the net have attempted to acquire release rights to many items and have been told that the owners are not interested at this time.

bob

I do have a CD-ROM Disk for the Atari 8-bit that has over 8,000 public domain share ware utilies, games docs ect. Version 1.1 has over 9,000+ files and directories. 80% of this comes from the Pool Disk from Europe, 2 USA Club Libraries and one set of help files in *.txt format.

: Does anybody know?

: Thanks.

: Tom

If your purpose is to print documents, the Ape Face I am sure would be a
fine interface for a dot matrix printer. If you want to run APE the PC
program which works with the SIO2PC interface, you need an SIO2PC....and
of course a PC.

The only thing that "APE" and the "Ape Face Printer Interface" share is
the word "Ape".

Jon,

When Jason Compton refers to AR as freeware he probably just means that the author(s) released it recently into the public domain. I think I remember reading that too.

There are different 'cracked' images floating around out there, with varying functionality. The amount of intricately devious copy-protection on the original AR diskettes probably set a record that still stands. So I think there are a few half-cracked images circulating as well.

So your task, I guess, is to find the image set that is totally cracked without any lingering problems.

Huh? I think you're thinking of the serial printer port, which is used for LocalTalk (aka AppleTalk) and other stuff. Most newer models now come with a built-in Ethernet port, which is about 10 times faster. ADB (Apple Desktop Bus) is mostly used for the mouse and keyboard(s), but is also used for joysticks, graphic tablets, etc. Never heard of it used for networking--all Macs already had built-in AppleTalk networking before ADB was introduced.

ADB has some limitations as far as number of devices and speed. It also is powered, so it's risky to mess with it when the computer is on. Devices are usually daisy-chained, though some early models had two ADB ports.

USB is much faster and the number of devices you can daisy chain is high (though I can't remember how high--128?). It's also "hot-swapable" meaning you can connect and disconnect devices while the computer is running (though, as Mr. Gates demonstrated recently, it doesn't always work, at least with Windows :-).

This discussion reminded me of when I first got a Mac after I had been using Atari 8-bits for several years. I remember reading the chapter in the back of De Re Atari titled "Human Engineering" which explained how Atari computers were designed to be used by ordinary people--not computer experts. The design goals of the Atari Home Computers sounded very familiar. Apple likes to brag that they invented easy-to-use computers with the Mac, but they were not the first.

Why anyone would want to port over Apple II games over to the 8bit is
beyond me? The atari was a much better game machine than the Apple
series. (especially the sound chip!) I think Apple had a slighly better
resolutio (maybe that's why all the Atari version were done in Gr.8 to
show the 8bit had a hi-res 320*192.. hehheh 320*192 is ultra-lo-res
nowadays..

> Someone else mentioned Synapse's Chicken. The early Synapse games were

> Shadow World? I've got these on my list at
> <http://www.dadgum.com/giantlist.html>, but I've never seen either game.

Nautlius and Shadow World both needed a translator to work on the Xl.
They had catchy tunes and showed off some decent Atari features.
(Nautilius for a 1982 game had some well done grafx, (for it's time)

Another great game for its time had to be Sirius' Wavy Navy.. it was a
shooter like galaxian but had a novel concept of your shooter would be
moving up and down on a "sine wave"... not bad for 1981. And sirius
software had released some dud software as well.

That would be a great idea, but it doesn't work! I tried with
un-protected Alternate reality disks, the city and the dungeon. The
problem is Alternate reality (both versions) use custom disk formats.

Which means both the City and the Dungeon "die" went you port them over
onto the hard disk. On a pleasant note I got Phantasie II running fine
off my Black Box/HD equippeed Atari 800xl about 5 years ago. Certauinly
not as good as the AR Series, but Phantasie II was a great game. (It
unfortunately dies when you run it under Xl IT.. has ANYBODY got this
game working perfectly under ANY emulator???

Michael, that's a great ribbon replacement for a _1025_ printer, not a
1027.

I believe there used to be a replacement ink roller for the 1027 and it was
available (2 on a card) at Radio Shack, but I never bought one myself.

WOW, you want to see shamus faster..stick it on NTSC setting and be
prepared to die real quick :)

And don't mention shamus 2 :)))

I'm was a diehard Atarian (2600, 1200XL, 1040STf, and Jag), but there was some things that impressed me about the C64. For one thing, the games were more colorful. A lot of the cool modes that looked awesome in graphic demos weren't really useful for games. Like, ooh, have 128 colors at once. Any game really use that GTIA mode usefully?

Some games were tons better on the Atari (namely, the LucasArts games especially BallBlazer) than the C64 but the C64 had some better versions. People say that it's only because the game was optimized for the C64 and was a bad port to the Atari. Well, a lot of times, they were done by two completely separate programming groups.

: remember reading that too.

Actually, they released it as freeware, as I originally said. Philip
Price retains the copyright but no longer restricts distribution. If it
was public domain, he would have relinquished that copyright, but that is
not the case.

: So your task, I guess, is to find the image set that is totally cracked
: without any lingering problems.

There are a variety of websites with fully working images. I haven't kept
up to date but a quick search on "alternate reality" using the web search
site of your choice will turn them up.
